University of the West of Scotland

Final Report

Exploring final year Initial Teacher Education students and probationary teachers’ ways of knowing and meaning-making through professional reflective practice.

Executive summary

The research outlined in this report was initiated in response to a call by the Scottish Government for educational researchers to focus attention on aspects related to attainment, and in particular to seek to understand the challenges faced by the education system as it endeavours to close the ‘attainment gap’ between the most and least disadvantaged pupils in our schools. In response to this challenge, the Scottish Government has implemented a range of policy initiatives, from the Attainment Challenge and the Pupil Equity fund to the National Improvement Framework for Scotland to support and drive change in the education system. An important aspect of these policy initiatives is the call for teachers, at all levels of the system, to improve school (and pupil) performance by increasing the use of data-informed decision making, through the systematic gathering and monitoring of performance information in terms of assessing children’s progress as part of the school improvement cycle.

Central to the effort to gain an understanding of how this policy context is operationalised is the need to gain an insight into teachers’ (and student teachers’) attitude towards the use of data to inform classroom practice. In addition, there is a need to explore how Scottish teachers (and student teachers’) conceptualise what educationally relevant ‘data’ is, what they see as important data/evidence/information to be gathered, how they gather that data, what they do with that data in terms of analysis and interpretation, and how those analyses and interpretations are used to inform professional judgements and decisions at the classroom level in order to make appropriate adjustments to pedagogy.

The UWS project aligns to this need to gain greater insight into how teachers used educationally relevant data by exploring how early career teachers (final year initial teacher education students) come to know and make meaning from educationally relevant evidence (data/information) as part of their reflective practice. Our research used an exploratory, sequential, mixed methodology approach to gather multiple sources of data from three groups of initial teacher education students studying on the Professional Graduate Diploma in Education (Secondary), Professional Graduate Diploma in Education (Primary) and Bachelor of Arts (Hons) Primary Education programmes within the University of the West of Scotland over academic sessions 2018/19, 2019/20 and 2020/21.

Our findings indicate that final year initial teacher education students’ attitude towards the use of data differs depending on their programme of study. Attitude profiles indicate that final year initial teacher education students’ attitude can shift positively towards the use of data over time. As evidence by shifts in the attitudinal profiles of students from all three programmes.

Context dependency emerged as a critical factor in final year initial teacher education students’ attitude towards the use of data. This factor summarises attitudes around items such as the availability of data handling tools, ready to use packages of materials to support data-informed decision making, and the support of colleagues in school to use data being important to their decision to engage in data-informed decision making. Enjoyment also emerged as important but in a negative way. In all student groups, the level of enjoyment was low and this impacted upon the affective state domain of attitude towards the use of data. For example, the number of students from all three groups identified as being low in enjoyment and highly anxious increased in the Post questionnaire analysis compared to the Pre.
Interestingly, our findings indicate that having a STEM background did not significantly improve attitude towards the use of data as part of reflective practice with the only difference being in the enjoyment subscale between those with and those without a STEM background. Unsurprisingly, those with a STEM background enjoyed working with data more than those without a STEM background.

While it is encouraging to note that final year initial teacher education students’ attitude towards the use of data to inform practice can improve over time, other findings indicate that when these students are asked to analyse, interpret and make meaningful inferences from tracking and monitoring data, they struggle to full appreciate what the data has to say and have difficulty making sense of the messages that emerge from such data in terms of pupil attainment, what that data indicates about teaching and learning and what school level to national level data has to say about school performance year on year.

In particular, undergraduate primary students performed significantly less well in comparison to PGDE secondary and PGDE Primary students. However, what was of more concern was that 52.21% of PGDE (S) Secondary students, 61.0% of PGDE (P) students and 90.2% of BA4 students scored ≤ 50% in the Data Literacy 1 activity. This suggests that more targeted support is required to help these students to develop the necessary data literacy skills required by the new General Teaching Council for Scotland Standards for Provisional Registration and the National Improvement Framework which requires student teachers to make effective use of such data to direct pedagogical decisions and professional judgements.

When considering what forms of data and evidence final year initial teacher education students draw on as part of their reflective practice, we found that the students within our sample draw heavily on observing teacher and school-based mentor feedback, teacher directed activities such as formative assessment and pupils’ work. However, they made limited use of summative assessment evidence within their lessons reflections. In addition, the students did not make effective use of their wider professional reading to help them develop their teaching practice. We suggest that this provides evidence of a theory-practice gap. We believe that as ITE tutors we need to support our students to navigate this gap in order to develop further our students’ efforts to translate educational theory into concrete examples for classroom practice. These findings also indicate that there is a need for more targeted research to explore when, where and how assessment evidence is utilised in schools and to assess the extent to which student teachers are exposed to these practices when on placement. Evidence from the semi-structured interviews suggests that, particularly in primary schools, many students are not exposed to such practices on placement due to the timing of placements within their programme of study. This indicates a potential ‘gap’ in their school experience which is only filled when they reach the Teacher Induction Scheme.

To this end, the research team incorporated a data literacy activity that introduced two professional scenarios into the project. Each scenario contextualised the use of data within a meeting with parents and caregivers to discuss pupil progress and a meeting with their principal teacher to discuss their class/classes progression. The findings from the analysis of student responses to the two professional scenarios indicated that despite the fact that student teachers do not draw on summative assessment regularly to drive their reflections on practice, when they are preparing to discuss pupil progress with parents and caregivers, they view summative assessment data as the basis for those discussions, with the addition of other data such as
attendance and behaviour data featuring highly in their responses. In terms of summative assessment, 89.1% of PGDE (S) and 94.1% of PGDE (P) students indicating that they would take this type of data along, while only 20.3% of PGDE (S) and 23.5% of PGDE (P) students specifically mentioning that they would take formative assessment evidence along. There is also a difference between PGDE (S) and PGDE (P) students mentioning that they would take homework scores along with 37.5% of PGDE (S) and only 7.8% of PGDE (P) students mentioning they would take homework scores along to the meeting. However, this is contrasted by the fact that 23.4% of PGDE (S) and only 19.6% of PGDE (P) students suggested that they would take along examples of pupil homework.

These findings suggest that PGDE (S) and PGDE (P) student teachers conceptualise their approach to using data within the context of these discussions as being oriented in a specific way - from positive (areas of strength) with evidence from the data to support their claims, towards the more negative (areas for development) again with evidence produced in the form of data from summative assessments and attendance/behavioural records and formative assessments/examples of classwork that shows a need for development. In terms of scenario two, the meeting with the principal teacher, the PGDE (S) and PGDE (P) students would take along similar types of evidence to the meeting with parents or caregivers, with an even greater emphasis being placed on summative assessment as the prime source of data to stimulate discussion, with the addition of other context related evidence to support those discussions. One thing that did emerge from the findings was that PGDE (S) students were not as aware as they might have been (through lack of experience) that the principal teacher would also bring data to this meeting which would involve their class data being compared to other classes in the department at the same level. However, a sizable minority of both PGDE cohorts suggested that they would feel nervous [37.5% of PGDE (S) and 43.1% of PGDE (P)] with approximately one fifth of PGDE students suggesting that they would be anxious in the lead up to and during that meeting. This is contrasted by the fact that one third of PGDE students suggested that they would be open minded during the discussion and that over half (54.9%) the PGDE (P) and approximately three quarters (71.9%) of the PGDE (S) indicated that they would be confident in their use of the data to support their perspective.

In terms of the findings from the semi-structured interviews, all three cohorts of final year ITE students see a clear distinction between the terms data and evidence. The PGDE (P) and BA4 students in particular describe the open and more inclusive nature of the term evidence in contract to data. Also, the findings suggest that there is a tangible fear of using and handling data within the BA4 cohort particularly, which is less perceptible within the PGDE (P) cohort interviews and is better described as a wariness of using data consistently within some of the PGDE (P) and PGDE (S) responses. Timing of school placement was seen by the PGDE (P) and BA4 students as important as they often did not see data being gathered or used consistently across the range of placement that they had since most primary schools do significant pieces of summative assessment at times when either the BA or PGDE (P) students are on campus or in late May/early June when the academic session is finished, thereby limiting their experience of engagement with aspects of school life such as the administration and result management of the National Standardised Assessments at P1, P4 or P7.

Taken as a whole, the findings from this research provides a number of useful insights into what support Initial teacher education within the Division of Education at the University of the West of Scotland has to do to support and better prepare our students in order to equip them to
function within contemporary school environments. We therefore intend to further develop teaching sessions and workshops designed to support student teachers development of data literacy skills by providing them with authentic, setting and stage specific, data analysis and interpretation learning experience. We will further enhance school placement tasks designed to heighten student teachers awareness of the diversity and range of data available for teachers to use and the importance placed on their ability to use data by stakeholders within the education system.

First they said they needed data about the children to find out what they’re learning. Then they said they needed data about the children to make sure they are learning. Then the children only learnt what could be turned into data. Then the children became data.

Michael Rosen read this poem to the Last NUT conference 2018 as a cautionary lesson for the profession.

Introduction

Over the last two decades, many Western democracies have implemented laws and policy reforms focused on education and schooling. These reforms are designed to put the child at the heart of the education system and place demands on teachers to use multiple sources of evidence to guide their professional judgments and decisions to improve the educational outcomes for all children and young people. Notable examples of these law and policy reforms range from the No Child Left Behind Act (2002) - now superseded by the Every Student Succeeds Act (2015) - in the United States, to the Education (Scotland) Act (2016) in Scotland. The Education (Scotland) Act 2016 put the National Improvement Framework (NIF) on a statutory footing and aims to reinforce a number of other educational policies initiatives in particular, Getting It Right for Every Child (GIRFEC).

In December 2019, the Scottish Government launched an update to the NIF entitled Achieving Excellence and Equity 2020: National Improvement Framework and Improvement Plan (Scottish Government, 2019). This document reaffirms the claim that the NIF and Improvement plan “complements the ongoing implementation of Curriculum for Excellence (CfE), Getting It Right for Every Child (GIRFEC), and Developing the Young Workforce (DYW), which are the three supporting pillars of the Scottish education system.”(Scottish Government, 2019 p .4) In addition, it sets the main priorities and key performance indicators for the education system for 2020.

In practical terms, the NIF is underpinned by four priorities. The first priority focuses efforts to improve attainment, particularly in literacy and numeracy. The second priority focuses on ‘closing the attainment gap’ between the most and least disadvantaged pupils. The third priority focuses on improving the health and wellbeing of pupils. Lastly, the fourth priority focuses on improving employability skills and sustained, positive school-leaver destinations for all young people. To deliver the desired improvement in educational outcomes for all Scottish pupils, the NIF has six ‘drivers’.

1. **School Leadership**: how we develop and support our head teachers and how we develop leadership across all parts of our school community
2. **Teacher Professionalism**: how we support teachers in their professional development
3. **Parental Engagement**: how we ensure the maximum benefit of parental involvement and engagement in children’s learning and in the life of the school
4. **Assessment of Children’s Progress**: how we gather (data) information about children’s progress and how we use this (data) information to support improving outcomes for all
5. **School Improvement**: every school has a responsibility to evaluate how well it is doing against the National Improvement priorities and other performance measures. These are

---

1 While many Scottish Government policies such as the NIF refers to children and young people, we will use the term pupil in reference to children and young people as this is a more common way to speak of school aged children.
evaluated by the schools themselves, by the local authority and by Her Majesty’s Inspectors’ of education (HMie) inspections

6. Performance Information: how we gather and analyse (data) information to help us target areas for improvement, show where we have been successful and where we may need to do more.

It is important to highlight here that three of the six drivers focus on the gathering, analysing and interpreting of information/data/evidence about pupil (and by extension school) performance, to support improvements in outcomes for all pupils.

Clearly these drivers imply that teachers in general, and head teachers in particular, ought to be cognisant of, and conversant with the multiple lines of evidence available to them relating to pupils learning. Whilst placing the onus on them to be able to make effective professional judgements about pupils learning and be able to act on those judgements in a manner that facilitates improvements in pupil performance outcomes. In addition, the other professional drivers relevant to this context are the General Teaching Council for Scotland’s (GTCS) Standards for Registration, Career-long Professional Learning and Leadership and Management which specify the need for teachers to reflect on and be professionally enquiring into all aspects of their teaching practice.

For a long time, teachers have been collecting and using many different forms of ‘data’ both formally and informally (Mandinach & Gummer, 2016). We suggest that this is nothing new. For example, teachers assess the level of pupils’ engagement, attentiveness and alertness in class. They observe and react to pupils’ behaviour and performance. They monitor pupils’ learning strengths as well identify areas for further learning and development. Every day, teachers make professional judgements regarding what pedagogies to use in lessons, as well as assessing whether there is a need to provide pupils with social or emotional support. Furthermore, teachers have to judge when it is appropriate to make accommodations for pupil behaviour in order to support pupils, in an effort to help them make progress. While these examples cover a range of sources of information that teachers engage with every day, many of these examples are difficult to utilise in a concrete and systematic way. While many of the observations made by teachers provide contextual information with regards to pupils’ learning, only a few of these provide measurable evidence of learning and progress over time.

Whilst we acknowledge that the range and nature of the data available for teachers to use to support their decision making as part of their reflective practice is growing, we note that parallel to this growth is an increasing awareness that teachers must understand how to use ‘tangible’ evidence to inform their decisions rather than overly relying on anecdotes, intuitions, or personal preferences. We suggest that there is a growing need for educational researchers to ask How prepared are pre-service and in-service teachers to handle, use and make meaning from different forms of educational data in order to meet the broad aims of the NIF?

Moving forward, we would like to make four observations that we feel are relevant to the NIF. First, there is an argument that the NIF, while espousing the notion of placing pupils and the teaching and learning process at its centre, that it more accurately places measurement (i.e. the gathering of data/information/evidence) at its’ centre. This point reminds us of the poet and children’s author Michael Rosen’s speech to the last National Union of Teacher Conference in 2018 which cautions us to be vigilant against the slide towards children becoming data (see the poem at the beginning of
While we acknowledge that schools are about many things, we also accept that they are first and foremost about teaching and learning.

Second, the NIF focuses attention on educational outcomes and the need to systematically measure these over time in order to establish baselines and to monitor progress. Implied in this observation is the need to be more intentional in identifying what is being taught by teachers and learned by pupils. Third, the NIF has brought renewed emphasis to the learning experiences of all pupils in all schools – not just a select few and as such we agree that it is aligned with other educational legislation and policies. Finally, the NIF underlines the need to increase the organisational learning capacities of schools, local authorities and Regional Improvement Collaborative (RIC). The primary focus of this organisational learning being on the effective and efficient alignment of classroom practice with specified learning outcomes where the lifeblood of this learning process is the data generated by teachers in schools as they go about pursuing this alignment with consistency. Framed in this manner, organisational effectiveness can be understood as a function of how strategically a school, local authority or RIC consistently uses data generated in and around its core task (i.e., teaching and learning) to inform ongoing decisions in the pursuit of quality learning outcomes for all pupils.

This educational context (and policy discourse) has created an environment in Scottish education that encourages teachers to engage in evidence-based or more specifically data-informed (driven) decision making as part of their professional reflection on pupils’ progress and by extension their teaching practices with the expressed aim of improving educational outcomes for all pupils. It is within this context that the UWS research project is situated.

The UWS research project aims to...

- Characterise final year Initial Teacher Education (ITE) students’ attitude towards the use of data within their practice;
- Explore how final year ITE students handle, analyse and make meaning from educational data as part of their professional judgment and decision making processes.
- Explore what evidence final year ITE students draw on as part of their written reflection focused on lessons taught during their teaching practice placements.

Research questions

In order to achieve the project aims, the UWS research team set the following research questions.

1. Does final year ITE students’ attitudes towards the use of data differ according to programme of study?
2. What factors impact final year ITE students’ attitudes towards the use of data?
3. Is it possible to improve final year ITE students’ attitudes towards the use of data, through focused teaching sessions?
4. To what extent can final year ITE students’ analyses and interpret educationally relevant data as part of their reflective practice?
5. What type’s information/evidence/data do final year ITE students draw on as part of reflections on lessons taught during episodes of teaching practice?
6. To what extent do final year ITE students use data to improve pupil’s learning and their teaching?
Framing the questions
In this section, we describe how we have theoretically framed the research questions. First, we situate the study specifically within the Scottish educational policy context. Second, we describe the key areas of literature that relate to teacher knowledge and patterns of knowing. Third we ground this context and the theory of teachers’ knowledge and patterns of knowing within the contemporary literature on reflective practice. Finally, we draw on literature relating to attitude in general and focus this specifically on how we theoretically framed the questionnaires used in the quantitative phase of the research to ground their use in the study within the realm of the individual student teacher.

Scottish Educational Policy context
As previously stated, internationally there has been a shift in educational policy towards evidence-based decision-making within schools (Mandinach, 2012; Schildkamp, Karbautzki, & Vanhoof, 2014; Scottish Government, 2017). This has resulted in increased political pressure on national education systems to account for perceived deficiencies in pupils’ educational outcomes and further has led to calls for teachers to engage more deeply with educational data as part of their reflective practice to guide their professional judgement and decision-making processes.

The policy drivers specifically relevant to the UWS research project are the National Improvement Framework (NIF) for Scotland, and the GTCS Standards for Registration (SfR). In general terms, the NIF focus on how teachers, principal teachers/faculty head teachers and head teachers use data to inform their professional judgements and decision making processes as part of their professional practice. These judgements and decisions being predicated on the desire to improve the educational outcomes for all pupils through assessment of pupil progress, the use of performance information/data/evidence and efforts to improve school performance against the National Improvement priorities and other performance measures. In terms of the GTCS standards, there are a number of standards that frame and position final year ITE students within the context of this research.

More specifically the relevant SfR (GTCS, 2012) statements that relate to the UWS project are

- 2.1.2 - Have knowledge and understanding of the relevant area(s) of pre-school, primary or secondary curriculum;
- 2.1.5 - Have knowledge and understanding of the principles of assessment, recording and reporting;
- 2.3.2 - Have knowledge and understanding of the importance of research and engagement in professional enquiry;
- 3.1.3 - Employ a range of teaching strategies and resources to meet the needs and abilities of learners;
- 3.3.1 - Use assessment, recording and reporting as an integral part of the teaching process to support and enhance learning;
- 3.4.1 - Read and critically engage with professional literature, educational research and policy; and
- 3.4.2 - Engage in reflective practice to develop and advance career-long professional learning and expertise
In terms of the revised Standard for Provisional Registration (GTCS, 2021) there are a number of standards which are relevant to this research.

- 2.1.1 - Have knowledge and understanding of Pedagogical Theories and Professional Practice.
- 2.1.2 - Have knowledge and understanding of Research and Engagement in Practitioner Enquiry.
- 2.1.3 - Have knowledge and understanding of Curriculum Design.
- 2.1.4 - Have knowledge and understanding of Planning for Assessment, Teaching and Learning.
- 3.1.4 - Employ assessment, evaluate progress, recording and reporting as an integral part of the teaching process to support and enhance learning.*
- 3.3.1 - Engage critically with literature, research and policy.
- 3.3.2 - Engage in reflective practice to develop and advance career-long professional learning and expertise.

*This standard specifically suggests that student teachers should demonstrate their professional skills and abilities require them to be able to record, analyse and use assessment data to evaluate Learning and teaching; use the results of assessment to identify development needs at class, group and individual level.

**Teachers knowledge and patterns of knowing**

Research on teacher knowledge suggests that teachers draw upon a variety of knowledge types, learn and use that knowledge within their professional practice in a variety of different ways, and for a variety of purposes (Markauskaite & Goodyear, 2017). It is clear from a cognitive standpoint that teachers’ professional knowledge comes in many forms and develops formally, informally and in non-formal ways (Eraut, 2000; 2004; 2007).

In an effort to describe the form that teachers’ professional knowledge might take, Michael Eraut suggests that professional knowledge can be characterised in a number of ways,

- **Codified knowledge** (propositional knowledge - discipline based theories and concepts, generalisations of practical principles; accumulated memories of episodic events and specific propositions about particular cases, decisions and actions);
- **Personal understandings** of people and situations, practical wisdom, tacit knowledge and aspects of personal expertise including personal knowledge and interpretation of experience;
- **Self-knowledge**, attitudes, values and emotions – senses of meaningfulness of the purpose, sense of choice, extent to which one feels supported, encouraged or discourages;
- **Meta-processes** – process knowledge for directing one’s own behaviour and controlling one’s engagement in other processes. This includes agency and reflection; and
- **Know-how or process knowledge** – knowing how to conduct the various processes that contribute to professional action, skills and practices (Eraut, 1994; 2009; 2010).

This characterisation fits well with the Aristotelian conception of different modes of knowing as episteme (true and certain propositional knowledge scientifically derived), techne (know how), doxa (commonly held attitudes and beliefs or self-knowledge) and phronesis (practical wisdom or meta-processes) (Grint, 2007; Eisner, 2002). Teachers’ propositional knowledge often characterised as their subject matter knowledge, does not fully encompass the range of knowledge held or applied.
by teachers in order to engage in effective teaching and learning. In order to express how teachers practically utilise their growing professional knowledge within the complex dynamics of the classroom we need to understand the other forms of knowledge teachers engage with beyond subject matter knowledge.

In the mid-1980s Lee Shulman (Shulman, 1986, 1987) introduced the concept of Pedagogical Content Knowledge (PCK) to describe the knowledge that teachers use to transform particular subject matter for student learning, taking into account possible (mis) conceptions and learning difficulties (Berry, Depaepe and van Driel, 2016). Shulman argued that this knowledge, associated with “the most regularly taught topics in one’s subject area” (Shulman, 1986, p. 9), includes representations of knowledge (analogies, illustrations, examples, explanations, and demonstrations), and student learning difficulties and those strategies effective to deal with them.

According to this conceptualisation, PCK is a subcategory of content knowledge, topic-specific, and includes two further subcategories - knowledge of representations and of learning difficulties and strategies of overcoming them. While the topic-specificity of PCK was neglected by some researchers, the conceptualisation of PCK as a subcategory of teacher content knowledge (as subject matter knowledge for teaching) has been accepted. Interestingly, Shulman (1987) identified PCK as a category of the knowledge base of teachers, as one of seven categories that also included content knowledge, general pedagogical knowledge, curriculum knowledge, knowledge of learners and their characteristics, knowledge of educational contexts, and knowledge of educational ends, purposes and values. While the notion of PCK has been influential in research on teaching and teacher education in a variety of disciplines (Science, mathematics physical education and technology), the concept has been criticised as lacking an empirical underpinning, for having fussy boundaries, for being rather static and narrowly conceptualised. Over time, there have been a number of studies that have empirically shown that PCK is an important determinant of the quality of instruction and consequently, students’ progress (Baumert, et al., 2010). In terms of the second criticism, Gess-Newsome (1999) made a distinction between the integrative and transformative model of teacher knowledge where in the transformative model treats PCK as a unique form of knowledge on which teachers rely while teaching. It is important to note that PCK is more than a form of factual knowledge that can be acquired and applied since research suggests that what teachers know or think cannot be separated out from what teachers actually do in class or what students gain from that teaching. In other words, PCK is a more dynamic construct that describes the process that teacher employ when confronted with the challenge of teaching particular subjects to particular learners in specific settings (Shulman, 2015).

This perspective advocates a more complex view of PCK that is knowing-to-act and is inherently linked to, and situated in, the act of teaching within a particular context. We would argue that while PCK can be viewed as the knowledge of expert teachers, that, in a normative and prescriptive way, can be passed on to student and newly qualified teachers, it is also the professional knowledge that each teacher develops on the basis of their experiences during teacher education and in practice, and as such is inseparable from the context in which it is developed and used. The concept of PCK has been expanded by researchers to include knowledge of curriculum and knowledge of purpose for teaching as well as knowledge of students understanding and knowledge of instructional strategies (Shulmans original components).
Patterns of knowing

Barbara Carper (1978) speaking from the nursing perspective suggests that knowing within all experience can be framed within four fundamental patterns of knowing, the empirical; the ethical; the personal; and the aesthetic. The empirical refers to the science of professional practice i.e. education, being factual based, and descriptive. The ethical which specifically focuses upon ‘matters of obligation’ or what ought to be done and relates to action. The aesthetics refers to the art of professional practice i.e. teaching. This pattern being the most difficult to succinctly describe as it includes such things as an appreciation of the pupil experience; the design of teaching and learning activities; and the relationship of the particular to the universal. Personal knowledge is concerned with the knowing, encountering and actualising of the concrete, individual self - the knowledge needed to engage in authentic personal relationships.

Christopher Johns (1995) framed learning through reflection within Carper’s fundamental patterns of knowing as a useful way to support individuals to make sense of their practice and to perceive the dimensions of their personal knowledge. In so doing, he integrated the four patterns of knowing more clearly within cue questions that practitioners might pose as part of their reflections. Others such as White (1995) added Socio-political knowing as a fifth pattern and Heath (1998) added the pattern of Unknowing to Carper’s original construct of knowing within professional practice. Socio-political knowing includes understanding factors that impact upon the teaching profession. Examples of such factors might include the behavioural culture within schools that surrounds teaching, the politics that govern it, and the complex physical, fiscal, and psychological environments of each school setting.

Unknowing as a pattern of knowing is a somewhat paradoxical concept that relates to the growing awareness that a student teacher does not know and cannot know or understand reality when they first encounter it. Taken in the context of teacher epistemology and ontology, unknowing represents the idea of openness, of qualitative receptivity to what may be learned, and of acceptance that not all the important questions have been asked and that many answers to both scientific and philosophical questions remain elusive (Heath, 1998; Averill and Clements, 2007). By recognising this ‘unknowing’, student teachers can remain alert to multiple perspectives while acknowledging their own lack of empirical knowledge, which enables them to avoid the belief that formal theory and research is applied or rejected without thought.

Unknowing promotes alertness to learning how, when and where theory and research may be applied to produce desirable outcomes. In the education literature, there are two pictures presented of the teacher - that of the expert practitioner and of teaching dominated by routine and coping. The former could represent awareness of unknowing that permits progress, the latter early closure with confidence in one’s own state of knowing, albeit at times resulting from external pressures to get through the work. Jacobs-Kramer and Chinn (1988) argue that all knowledge patterns must be integrated to enable deliberate professional judgements and that failure to integrate these knowledge patterns impedes choice and produces negative professional outcomes. Unknowing assumes that knowledge is tentative and dynamic. It elevates the importance of questions over answers and releases preconceptions, stereotypes, assumptions and biases. Unknowing is essential for the advancement of educational practice but is also a rich arena for co-discovery between the student teacher and their pupils. When cultivating the pattern of unknowing, student teachers welcome challenge to authoritative knowledge, share responsibility and cultivate a sense of openness within their reflections.
When taken together as part of (student) teachers’ reflective practice, these patterns of knowing (Empirical, Personal, Ethical, Aesthetic, Socio-political and Unknowing) provide a richly diverse set of perspectives from which to draw on as they seek to shape their efforts to make meaning from their classroom experiences and drive the professional judgements they make about pupils’ learning and the effectiveness their teaching.

**Student teachers reflective practice**

Teaching is a practice-based profession that requires teachers (and student teachers) to develop the ability to reflect upon the experiences and critical incidents they encounter during teaching practice. The way student teachers make sense of these experiences is complex, often problematic and has resulted in reflective practice becoming an increasingly important area of focus for educational research since the ability to effectively reflect on practice forms an important aspect of initial teacher education across Europe (Gillies, 2016).

The discourse surrounding reflective practice within initial teacher education identifies its’ utility in assisting student teachers to make sense of their practice by broadening their perspectives within practicum and supports their efforts to address the many challenges they face during teaching placements (McGarr and McCormack, 2014). However, when professional reflection is poorly done, particularly when practiced without sufficient care and attention being taken to ensure that the judgements made as a consequence of reflection are soundly based in terms of attention to wider reference-points, then reflection risks becoming ‘ritualistic’ (Moore 2004, p. 105), solipsistic navel-gazing, or an exercise in narcissistic self-affirmation (Gillies, 2016).

The concept of knowing involves a unique type of personal knowledge composed of objective knowledge, which interacts with the individual’s growing attention, perception and awareness of developing acts of practice, and the subjective perspective on personal experience gained during practice (Mathewson Mitchell, 2013; Bonis, 2009). This perspective on knowing and by extension reflection, acknowledges the dynamic nature of reflection as both process and product. The main attributes of how students comes to ‘know’ and make sense during practice lies in personal experience, knowledge (epistemic, procedural, tacit, ethical and aesthetic), and is shaped through personal perspectives.

The ontological assumption underpinning this view of knowing through reflection is objective knowledge (logically constructed) and subjective knowledge (inductively constructed through reason). A practical question is how might initial teacher education facilitate students’ development as a reflective practitioner? Answering this question is made all the more difficult by the complex nature of the concept. Where do ITE tutors begin to untangle this complex, multifaceted and dynamic process? Often this begins with the use of personal narrative, usually within the evaluation and reflection sections of formal lesson plans. However, ITE students’ tend to compartmentalise their reflections around stimuli emergent from critical incidents or problems that occur within lessons rather than reflecting the positive aspects of the lesson i.e. learning gains by pupils or what they have learned about their own practice. For reflective practice to act as an approach to promoting ITE students self-awareness so that they gain a greater understanding of themselves as well as their own perceptions and actions relative to teaching practice, we need to understand how reflective practice is positioned within policy documents which guide initial teacher education.
Positioning reflective practice as a mechanism for improving practice.

For teachers and ITE student teachers, reflective practice has shifted from being a desirable disposition to a mandatory activity (Glasswell and Ryan, 2017) due in part to the emphasis placed on professional reflection within many countries teaching standards. For example, the General Teaching Council for Scotland’s Standards for Registration (SfR) (GTCS, 2012) states that

Student teachers should be able to reflect and engage in self-evaluation using the relevant professional standard; adopt an enquiring approach to their professional practice and engage in professional enquiry and professional dialogue; and evaluate their classroom practice, taking account of feedback from others, in order to enhance teaching and learning Standard 3.4.2 (GTCS, 2012 p. 19).

On the one hand, it could be argued from this example that the Scottish SfR positions reflective practice as a vital component of teachers’ work and professional identity. On the other hand, it can be argued that the SfR lacks clarity in terms of potential actions to be taken by student teachers since it makes no suggestions as to how they might go about (i) evaluating pupils’ learning; (ii) reflecting upon their developing classroom practice; and (iii) what they ought to focus on, and attend to, as part of the reflective process. Also, the validity of such reflections can be open to question, given the fact that student teachers’ ‘frames of reference’ can greatly impact upon the manner in which they focus and attend to aspects of practice. This notion suggests that students require more support, perhaps from their school mentor or ITE tutor, to reflect on the important aspects of a lesson in order to help the development of pedagogical content knowledge sufficiently to attain the required standard.

Glasswell and Ryan (2017) carried out a detailed analysis of how reflective practice was positioned within the teaching standard of six English speaking education systems (Australia, England, New Zealand, Scotland, Singapore and the USA) and have suggest that reflective practice (within these countries standards) is positioned as an evaluative process - where teachers evaluate their teaching, professional knowledge and their curriculum and lesson plans against standards and proscribed content; as an adaptive process – where teachers reflect on instruction to make adjustments for different groups, on teaching to improve it and on data in order to adjust teaching practice; as a collaborative process – where teachers work together to reflect on achieving improvements in teaching and learning, lead other teachers in reflecting on practice and learn from others to improve practice; and as a transformative process – where teachers reflect upon the social, political, ethical and moral issues in teaching and adjust their thinking in response to that reflection and where they examine their attitudes and dispositions and make adjustments when required.

Glasswell and Ryan’s analysis suggests that reflective practice is positioned as the key to improving teaching practice but that the process is only stated in general terms. They also draw attention to concerns that mandating a process for reflection does not encourage the systematic and critical analysis of what is important (in education terms) or what seems integral to the thoughtful application of good judgement. This begs the question how do student teachers engage meaningfully with reflective practice as a way of knowing and learning from teaching experience?

We suggest that if reflection is a key component of learning through experience as Glasswell and Ryan (2017) suggest, then it is important that student teachers are supported to use reflection as a means by which they can surface experiential knowledge. By this we refer to how the ITE student teacher assimilates or accommodates learning through reflection with existing personal knowledge.
It can be argued that the main purpose for advocating student teachers’ development of reflective practice is to enable them to access, appreciate, understand and learn, through lived experience, to take appropriate action towards developing increasingly effective pedagogical practice. As a consequence, student teachers’ respond to new situations from multiple perspectives and by drawing upon difference funds of knowledge. In this regards it is possible to argue that learning through reflection is a process of enlightenment, empowerment, and emancipation (Fay 1987). For example, ‘enlightenment’ is emergent form student teachers’ understanding of ‘who they are’ in the context of defining and understanding their practice; ‘empowerment’ is emergent from having the courage and commitment to take the necessary actions to change ‘who they are’; and ‘emancipation’ comes through them liberating themselves from previous ways of being to become ‘who they need to be’, as necessary to achieve effective practice.

As alluded to above, it is important to acknowledge that student teachers’ ‘frames of reference’ impact upon the way that they reflect upon experiences and how they focus and attend to critical incidents encountered during teaching practice. By frames of reference we mean the structure of assumptions through which individuals come to understand experiences. It is because individual student teachers bring different prior experiences; knowledge; associations; conceptual understandings; values and beliefs; feelings; and conditioned responses that their frames of reference colour the way they view classroom experiences emergent from teaching practice (Mezirow, 1997). Within the context of transformational learning, Jack Mezirow (1997) suggests that frames of reference tend to selectively shape and bound experiences, preconceptions, cognition and feelings. They shape individuals actions and they govern their decision-making in terms of how they accept or reject ideas that fail to fit their preconceptions by labelling those ideas as unworthy of consideration; aberrations, irrelevant or just mistakes. He further suggests that they encompass cognitive, conative and emotional components that are composed of ‘habits of mind’ and ‘a point of view’, where ‘habits of mind’ are broad, abstract, orienting, habitual ways of thinking, feeling and acting that are influenced by ones assumptions and constitute a set of codes (Mezirow, 1990; Mezirow, 1997). These codes might originate from political, social, cultural, educational, economic or psychological perspectives where they become articulated within a specific point of view – the constellation of beliefs, value judgements, attitudes and feelings that shape a particular interpretation of an experience. With these points in mind, we need to turn our attention to the ways that reflective practitioners might come to know within their professional practice.

**Gillies Heuristic of professional Judgement.**

Donald Gillies (2016) arguing from an Arendtian perspective suggests that in order to support student teachers to make good professional judgement they “need to be encouraged to articulate in specific detail the sources which were deemed relevant, the ideas being drawn on, and why, when reflecting on a particular professional issue or experience” (Gillies, 2016, p158). He suggests that to enable student teachers to make sound judgements about their practice, they need to bring together perspectives drawn from three broad themes: self; others; and literature.

The theme of Self relates specifically to how the student teacher draws upon personal experience, reading and principles and values. The theme of Others relates to evidence that the student teacher engaged with – peers; partners; and professionals. The theme of Literature relates to how the student demonstrates their use of publications by applying evidence from research studies of various forms and from various contexts; applying theory and research evidence; pedagogy; policy - drawing from policy and guidelines relevant data, and subjecting it to critique, where appropriate.
However, we suggest that in order for student teachers to engage in this type of action orientated professional reflection their frame of reference and in particular their attitudes and beliefs towards such professional behaviour needs to be understood. In the next section, we discuss the elements of attitude that impact on the way final year ITE students view the use of data.

**Final year ITE student teachers attitudes towards the use of data**

Research suggests that some teachers feel threatened by the concept of data-informed practice and under prepared to engage in data-driven decision-making (DDDM) (Dunn, Airola, Lo, and Garrison, 2013a). Emerging research evidence also suggests that many teachers do not systematically use data-informed judgements or if they do, they only trust the data that confirms their intuition rather than using data to shape their professional judgements (Dunn, Airola & Garrison, 2013b). It is at this point that the (students) teachers ‘frame of reference’ colour the way they privilege and legitimise certain forms of evidence / data / information. What these findings indicate is that many in-service teachers lack the skills, motivation or positive attitude towards the use of data to support their professional judgements. What is less well understood is how pre-service teachers are prepared to use the wide range of the data available to them and what factors affect their use of data within their decision making and professional judgement processes.

As a construct, teachers’ attitudes and beliefs towards the use of educational data is complex. Arguably it is teachers’ attitudes and beliefs that influence their action in the classroom. Therefore, information about teachers’ reasoning is required. While research suggests that ‘belief’ describes the ideas that influence teachers’ decision-making regarding pedagogy, classroom behaviour and the way they organise lessons (Beck and Lumpe, 1996). When clusters of beliefs are organised around an object or situation and predisposition to action, this holistic organisation becomes an attitude” (Pajares 1992). Attitude is a psychological tendency to evaluate an object (in this case the use of educational data by teachers) in terms of favourable or unfavourable, and attributes dimensions such as good/bad or positive/negative (Ajzen, 2001).

It is the evaluative element of this definition that plays a central role in distinguishing attitude from the concept of belief, which is more related to faith in or confidence that a principle can be accepted as true, often without proof; or opinions, which are personal beliefs or judgement which may or may not be formed through recourse to evidence. Attitudes, once formed, become stable, can be difficult to change, and are highly context dependent. Ajzen (2001) suggests that attitude is a complex construct composed of multiple dimensions and/or sub-components which require to be evaluated separately, since these contribute to varying degrees towards the overall object of attitude. If we are to understand final year ITE student teachers’ attitude towards the use of educationally relevant data better, then we need to understand the dimensions and sub-components that reflect that attitude.

Our study, drawing on Bandura’s social learning theory (Bandura, 2001) and characterises the dimensions of student teachers’ attitude towards the use of data within their professional reflections, by exploring the dimensions relating to the domains of cognitive belief (Perceived Relevance and Perceived Difficulty), the affective state (Anxiety, Enjoyment) and perceived control (Self-Efficacy, Context Dependency). In addition, it aims to explore how ITE students analyse and interpret educational data since we argue that the ability to analyse and interpret data is related to attitude through the concepts of Self-efficacy, Anxiety, Context Dependency, Relevance and Difficulty. We wish to clarify whether final year ITE students perceived self-efficacy when using educationally relevant data differs from their actual ability.
Methodological approach

In this section of the report, we address the methodological and the ethical approach taken to frame the research. In so doing, we outline the intended sampling strategy and the methods of data collection. Also, we describe the impact that the COVID-19 pandemic and subsequent lockdown had on the data collection between March 2020 and June 2020 where appropriate.

Methodology

The UWS sub-project research adopts an exploratory, sequential, mixed methods approach to investigate how final year ITE students use multiple forms of evidence as part of their developing reflective practice.

UWS sub-project has three strands.

1. **Improving** final year ITE students’ knowledge and understanding of issues related to disadvantage and low attainment, expanding the range of academic sources and data on which they can draw when considering related classroom challenges, and so aiming to improve the quality of educational decision-making by beginning teachers in relation to supporting pupils struggling with their learning.

2. **Exploring** how final year ITE students use evidence to make evidence-informed judgments regarding pedagogical choices and classroom management and organisational strategies designed to improve attainment within their classroom setting.

3. **Following** ITE students into practice and will focus upon how newly qualified probationary teachers build upon and utilise their knowledge and understanding of evidence-based decision-making during their professional reflection on pupils’ learning and what this means in terms of their developing pedagogical practice.

Research Design

In order to explore the three strands, we designed the research around sequential mixed method approach. The design incorporated three phases (1) An Instructional phase; (2) A quantitative phase; and (3) A qualitative phase (See Figure 1 for an overview of the research design).

Figure 1: Research design overview
The Instructional Phase
The instructional phase involved eight dedicated teaching sessions of 2 hours focused on the theory and practice relating to data literacy (three sessions), one session relating to the theory and practice relating to principles of assessment, one session each relating to a critical overview of the National Improvement framework and the theory and practice of practitioner enquiry and three sessions relating to the theory and practice of reflection in, on and for practice. These teaching sessions were facilitated by members of the UWS research team.

The Quantitative Phase
The quantitative phase of the project was broken down into two parts. The first part asked all of the final year ITE students across the three ITE programmes within UWS to complete a questionnaire designed to probe the final year ITE student teachers’ attitude towards the use of data within teaching practice (pre and post teaching placements). The questionnaire contained two sections, one asking demographic questions relating to gender, age, previous undergraduate degree (only from PGDE (S) and (P) students), and the local authority where their last teaching placement school was situated. The other contained 51 randomly distributed items from 10 subscales. Students’ placed their responses along a five-point Likert scale - Strongly Disagree (1) to Strongly Agree (5) dependent on their opinion where extremes of the scale were the only named categories. Each of the 10 subscales related to the dimensions of attitude towards the use of data within teaching practice. Six subscales related to four domains of attitude towards the use of data within teaching practice were – (1) The Cognitive Belief domain (Perceived Relevance, Perceived Difficulty); (2) The Affective State (Anxiety, Enjoyment) and (3) The Perceived Control domain (Self-Efficacy, Context Dependency). Two subscales related to Effectiveness for Pedagogy and Intentions towards Using Data and two subscales related to Reflective Scepticism and a Critical Openness originating from the Critical Thinking Disposition Scale (Sosu, 2013).

In the second part, all final year ITE students were asked to complete a paper-and-pencil data analysis and interpretation activity designed to explore how they analyse and make meaning from tracking and monitoring data. Each question in this activity was designed to take the students through the reasoning sequence outlined in their Data Literacy teaching sessions. This followed the conceptual framework for data literacy for teachers outlined by Mandinach & Gummer (2016). Through this conceptual framework, Mandinach & Gummer (2016) suggest that teachers should follow an inquiry cycle which moves from identification of a problematic issue, to refining that issue into a question or set of questions that can be examined empirically.

As the issue or problem becomes more clearly defined, teachers must identify and use data that might illuminate and refine what the problems are. The process describes the need to interpret and draw inferences from the data to transform the data in to a useable form. Teachers then must take that transformed data and turn it into decisions about classroom action to identify and implement a potential solution to the problem or issue. The final component of the cycle is to evaluate the outcome of the inquiry cycles work when the solution is implemented. Following this logic, the data analysis and interpretation activity was designed to assess student teachers ability to analysis and make meaning from classroom level data (section 1), from school level data (sections 2.), and from school to national level comparator data (Section 3).

To achieve this multi-layered assessment of student teachers ability to analyse educationally relevant data, the sequence of questions posed was designed to assess the extent to which student teachers can recognise the properties of a raw set of class summative assessment data (questions
This theme was continued in questions 1b (i-iii) which presents the student with a class set of assessment data in a transformed form and asked the students to analyse the data set to identify and make inferences in terms of general class attainment (Q1b (i)), which topic was best understood - Q1b (ii) and least well understood - Q 1b(iii) and to explain how they came to this answer. The purpose of these questions was to assess the general ability of the student teachers to pick out the headline messages from the data.

In section 2 of the data analysis and interpretation activity, question 1(c) and 1 (d) asked students to identify the highest and lowest attaining pupils and to explain how they came to this answer and to reflect on the data set as a whole as if this was their class what would this data set indicate about the pupils attainment and their teaching.

Section 3 contained two questions that use graphs to illustrate the need for teachers to analyse and make sense of school to national level data. In question 2, the bar chart shows data from school X relating to the percentage of Leavers attaining literacy and numeracy at SCQF level 4 and 5. In question 3, the graph shows data for school X relating to the extent to which school X improves the attainment of pupils from lower attainer to high attainer against national data in relation to the pupils Scottish Index of Multiple Deprivation (SIMD) decile placing.

The Qualitative Phase
The qualitative phase was also broken down into three parts. In the first part, of those final year ITE students that responded to the pre questionnaire, a sample of students from across the PGDE (S), PGDE (P) and BA4 Primary Education programmes were asked to take part in a semi-structured interview designed to probe the students perspectives on what they view as educationally relevant data, their feelings, attitudes and beliefs about using data as part of their reflective practice and what their experiences while on their first main teaching placement was with regards to how teacher used data day-today with them while on placement.

In the second part of the qualitative phase final year ITE students were asked to submit a sample of fully evaluated lesson plans to the research team so that they might explore what they reflected upon while on each teaching placement, and what evidence they used to drive their professional judgments as part of their reflective practice.

In the third part of the qualitative phase PGDE Primary and Secondary students were asked to reflect on two professional scenarios. The first scenario contextualised the use of data, their analysis and interpretation within the context of a parent and teacher conversation at a parents evening and involved the students reflecting on and answering four reflective questions relating to what data/evidence would they take along to that meeting; How might they use the data/evidence available to them to steer the discussion with a child’s parent or care-giver; How would they use the data to frame their comments to a parent or care-giver of a pupil who is making little progress overall or is struggling an area of the curriculum; and what would they say to the parent if they asked them what they intended to do to resolve any issue regarding their child’s progress that has arisen from the discussion?

The second scenario set the scene of a professional dialogue between the teacher and a Principal Teacher to discuss their classes’ progress. The students were asked to reflect upon and answer three reflective questions - What evidence will you gather to help you support that discussion?; What are
your feeling about the nature and direction of this discussion? Expand and explain any feelings by describing the feeling and why you might be feeling that way; and How might you react if the PT shows concern that pupil progress in the class is falling below expectation? Think about how you might use all of the evidence available to you to add context to the situation and what ideas might you bring forward to improve the situation?

**Ethics**

The UWS research project was designed to comply with the British Educational Research Association (BERA) ethical guidance for conducting educational research (BERA, 2018). In this regard, ethical approval for this study was sought from the School of Education and Social Sciences ethics committee in August 2018 and permission to carry out the study was given in September 2018.

**Sample and the impact of the COVID-19 pandemic and lockdown**

The study began in August 2018 and was initially planned to span two academic sessions (Session 2018/19 and 2019/20). The plan was to sample across the three final year ITE programmes – the BA (Hon) Primary Education, PGDE Primary (PGDE (P) and PGDE Secondary (PGDE (S)) within UWS. The initial phases of the study went well in terms of recruitment for the Quantitative and Qualitative elements of the programme. For example, the pre and post questionnaire for the first year of the study recruited 109 Pre and 102 Post PGDE (P) students; 71 Pre and 66 Post PGDE (S) students and 65 Pre and 49 Post BA4 (Hon) students. However, while we managed to recruit 86 Pre PGDE (P), 65 Pre PGDE (S) and 50 Pre BA4 (Hon) students in session 2019/20, due to the COVID-19 pandemic we could not complete the Post questionnaire since the date that these were due to be completed was the first day of lockdown and none of the students felt able to complete the questionnaire. As a consequence of being allowed to extend the research into session 2020/21 we managed to extend the sample size of the questionnaire to n= 177 pre and n=132 post PGDE Secondary students; n=241 pre and n=198 post PGDE Primary students; and n=118 pre and n=115 post BA4 Primary Education students.

At this point it is important to note that the power calculation for a moderate size effect of 0.4 indicates that we required a minimum of 140 participants in each group for the study to have sufficient statistical power. Given that only the PGDE Primary groups have reach this number of participants (Pre and Post) to meet this statistical milestone, with PGDE Secondary almost making this in the post sample, we would suggest that a further round of data gathering is required to have sufficient confidence in the inferences made from this research.

In terms of the data analysis and interpretation activity. We managed to recruit 51 BA4 students and 57 PGDE (S) but no PGDE (P) students in session 2018/19. In session 2019/20 due to the normal timing of the activity, no students could be recruited due to the COVID-19 lockdown. It is important to emphasise here that the COVID-19 pandemic has significantly impacted on the quantitative component of the study. Given that we were granted an extension to the study into session 2020/21 to complete this aspect of the study, we managed to recruit a further 79 PGDE Secondary students and 96 PGDE Primary students.

In terms of the qualitative phase of the study, we managed to recruit 3 BA4 students, 2 PGDE (S) students and 1 PGDE (P) student for interview in session 2018/19 with no students coming forward to be interviewed in session 2019/20. The low response rates in session 2018/19 is a measure of how busy these students are at the time of sampling. The lack of engagement with the interviews
by the students in session 2019/20 is due to the lockdown and the pressures that these final year ITE students were under at the time. Due to a lack of participation so far, and the impact of COVID-19 on the sampling for session 2019/20, we carried forward this work into session 2020/21 where we managed to recruit a further 7 PGDE Secondary students, 2 PGDE Primary and 2 BA4 students to the semi-structured interviews. This was achieved by changing the timing of the interviews to the period between the end of November and the beginning of December.

In terms of gathering the reflections on lessons taught element of the qualitative phase, we managed to recruit 39 PGDE (S) students, one PGDE (P) student and no BA4 students over session 2018/19. In session 2019/20, we recruited 29 PGDE (S) and no PGDE (P) and no BA4 students. The higher participation of the secondary cohort with this element of the study is partly due to the fact that two of the three researchers have a high involvement with the PGDE (S) programme as subject tutor so this group of students may be more trusting of them in comparison to PGDE (P) and BA4 students. The reflection on lessons taught data presented will come from the PGDE (S) cohorts however, due to the lockdown, we do not have data for the third teaching placement for PGDE (S) for session 2019/20 as placement did not take place.

A positive consequence of the COVID-19 pandemic was that we were able to introduce a Data Literacy task into the School and Professional Studies module of the PGDE (S) and PGDE (P) programmes that focused students’ attention on two professional scenarios that contextualised the use of data within two scenarios. The first scenario focused on the preparation for and engagement in a parent and teacher meeting (commonly known as a parents night) where discussion of pupils attainment and progress take place. The second scenarios focused on professional dialogue between the class teachers (in this case the student teacher) and the principal teacher. The discussion focused on issues of class attainment and progress.

The Analytical approach

Quantitative Data Analysis

Questionnaire analysis
Upon submission of the questionnaire, each group’s questionnaires were checked for completion, verified by checking for pattern or spoiled papers and processed by hand using a double entry system on an Excel spreadsheet. The data was then sorted into programme groups and then from the random order that each item was presented, into groups of items relating to each subscale. The data was then transferred to SPSS for downstream descriptive and inferential statistical analysis between the PGDE (S), PGDE (P) and BA4 groups.

For the tracking and monitoring data analysis and interpretation activity, the scripts were sorted into programme groups. They were then marked by two researchers and cross checked for concordance. All data was entered into an Excel spreadsheet and then transferred to SPSS for downstream descriptive and inferential statistical analysis.

The statistical analysis applied to the data set included multiple regression analysis to compare attitudinal subscale within and between participant groups as well as Mann-Whitney U-Tests, Chi-Square with Kendal’s Tauβ and Friedman ANOVA to compare differences between participants groups. In terms of the analysis between Pre and Post samples, an increase in the mean for the
subscale indicates an increase in agreement with the statements within the subscale and a decrease indicate more disagreement with the statements within the subscale.

**Qualitative Data Analysis.**

**Fully evaluated lesson plans**

The final year students that volunteered their fully evaluated lesson plans where sorted into programme groups, scanned and stored centrally for analysis. The fully evaluated lesson plans were analysed in a staged manner using a modified version of Gillies (2016) heuristic of professional judgement (see Table 1 below). In stage one, each lesson plan, evaluation & reflection was read once to ascertain the context of the lesson; to identify the learning outcome; and how the student planned to implement the lesson. This allowed the researcher to gauge the context and subject content for each lesson being evaluated. Then all lesson plans, evaluations and reflections were read for a second time and coded. The lesson plan, evaluations and reflections were then read for a third time to identify examples of students’ writing which typically reflected the main theme emergent from the heuristic of professional judgment. The number of times a specific code was mentioned by each student was collated and tabulated for further downstream analysis.

The tabulated data from the third stage of the qualitative analysis was then analysed statistically to assess whether the differences in the number of times a code was identified per student over each teaching placement were significantly different using a Kruskal-Wallis Test (one-way ANOVA) to explore potential differences between teaching placement data.

In addition, the fully evaluated lesson plans were analysed to characterise the range and type of information/data/evidence that the final year ITE teacher use to inform their reflections.

</tbody>
</table>
The total sample of lesson reflections analysed was \( n = 35 \) as this was the number of lesson plans submitted which covered all three teaching placements. The number was lower than anticipated because in academic session 2019/20 the third teaching placement was cancelled due to COVID-19 and in academic session 2020/21 the whole of teaching placement two was lost due to lockdown between January and April 2021.

**Semi-structured interviews.**
The data derived from the semi-structured interviews was gathered from fourteen participants from across the three ITE programmes at UWS. The number of participants from each programme was \( n = 7 \) PGDE (S) students; \( n = 3 \) PGDE (P) students and \( n = 5 \) BA4 students.

The semi-structured interview schedule was designed to capture the students’ views on the use of data within their reflective practice and within schools and was constructed around three sections. Section 1 focused on aspects relating to students’ attitude towards the use of data and supported the analysis of pre and post questionnaire data. The second section was focused on the students’ reflective practice, and the third section focused on the use of data in schools in terms of what the students experienced on school placement and how they and others in school used data (see Appendix 1 to view the semi-structured interview schedule).

The method of analysis of the interview data utilised the constant comparative approach from grounded theory where the analysis of the data consisted of three stages. In the first stage, categories were generated by reading the interview transcripts while listening to the audio files of the interviews in an attempt to identify common themes. This stage was the constructive phase of data analysis. The second stage involved the integration of the categories and their properties by comparing similarities and differences amongst the categories created in stage one. The third stage involved integrating the data around fewer, more encompassing categories which meant that new categories had to be created, these refined and sharpened, and existing categories further elaborated. However, this process was not linear; rather the steps formed an iterative process of coding, comparing, and refining (Glaser & Strauss, 1967) to form a rich description of what these student teachers’ conceptions of data use within their reflective practice were.
Professional Scenarios
As a research team, we recognised that we needed to support final year ITE students thinking on using data by helping them to situate and contextualise educational data use within their teaching practice. We therefore devised two professional scenarios to help them to situate educational data in terms of the who, what, when, where and why of using systematically gathered educational data as described on page 22 of this report (See appendix two for a detailed outline of the two professional scenarios). The student responses to each scenario were analysed using a thematic analysis (Braun & Clarke, 2006) and was structured around how students responded to each reflective question in the professional scenario.

Analysis of findings

The analysis of findings presented here is structured to follow the phases of the research described in the methodological approach section in terms of quantitative and qualitative phases. It is also important to note that due to the disruption of data collection in session 2019/20 caused by the COVID-19 pandemic and the subsequent lockdowns to face-to-face teaching activities such as school placements, we acknowledge that this analysis is as complete as far as the sample size allows but that it falls short of your intended sample targets.

In each sub-section, the findings and analysis are summarised. In the first subsection we outline the quantitative phase beginning with the Pre and Post questionnaire data which looks specifically at students’ attitude towards the use of data as part of their reflective practice. We then go on to describe the findings of the data analysis and interpretation of educationally relevant data activity, which focuses on student teachers ability to analyse and interpret data. We then follow up by comparing the attitudinal findings to the ability findings in order to assess whether there is a gap between final year ITE student teachers attitude towards using data and their ability to use different types of data. In the second sub-section, the qualitative analysis of the semi-structured interviews is outlined. This is then followed by a description of the findings from student teachers’ reflections and evaluations of lessons taught and an outline of the thematic analysis of the reflection content against Gillies Heuristic for Professional Judgement is proposed.

Quantitative analysis

Pre and Post Final Year ITE Students Questionnaire
Preliminary analysis of the reliability for each statements within the 8 subscales relating to the use of data within the questionnaire is good. The Cronbach’s Alpha for each participant group was > 0.75 with the PGDE (S) [0.904], PGDE (P) [0.84] and BA4 [0.85].

When we compare the three groups of final year ITE students – PGDE (S), PGDE (P) and BA4 – using a Mann-Whitney U Test to indicate differences between the groups we find that there are significant differences between the students groups. For example, when we compare the mean scores for the PGDE (S) with PGDE (P) we see significant differences in the mean scores for the Self-Efficacy, Anxiety, Enjoyment Relevance and Intention to Use Data subscales, with no difference between the PGDE (S) and PGDE (P) students in terms of their attitude relating to the Difficulty and Data Effectiveness for Pedagogy subscales. In terms of the Context Dependency subscale, there is no significant difference, however, the p-value (P= 0.06) indicates that there is a trend towards statistical significance when comparing PGDE (S) with PGDE (P).
In addition, when we compare the PGDE (S) with the BA4, we see significant differences in the Anxiety, Enjoyment, Relevance and Intention to Use Data subscales, with no differences in the Self-Efficacy, Context Dependency, Difficulty and Data Effectiveness for Pedagogy subscales. However, when we compare the PGDE (P) with the BA4 there is a significant difference between the mean scores for the Self-Efficacy and Context Dependency subscales but no difference in the Anxiety, Enjoyment, Relevance, Difficulty, Data Effectiveness for Pedagogy and Intention to Use Data subscales.

The mean scores (Pre and Post) for each subscale (see Table 2) suggests that there is a statistically significant difference between Pre and Post mean scores for PGDE (P) and BA4 Students in terms of Self Efficacy and Perceived Context Dependency, both of which increased while there was no significant difference in both subscales for PGDE (S). Interestingly, there was no difference between Pre and Post scores for the Anxiety and Enjoyment subscales for PGDE (S), PGDE (P) or BA4 students. There was a significant increase in agreement Pre and Post mean scores for BA4 students on the Relevance, Difficulty, Data Effectiveness for Pedagogy and Intention to Use Data subscales while there was no significant difference in these subscales for PGDE (P) students. It is interesting to note that there was a significant decrease in PGDE (S) students’ agreement with Items relating to the Relevance, Difficulty, Data Effectiveness for Pedagogy and Intention to Use Data subscales but no significant difference between Pre and Post for the Data effective for pedagogy and Intention to use data subscales.

Note: *Sig diff Pre v Post for a Mann-Whitney U-Test p<0.01

Analysis of the Pre questionnaires for the PGDE (S) and PGDE (P) suggests that with the exception of the Enjoyment subscale (p=0.038 Mann-Whitney U Test), there was no significant difference between the mean scores for each subscale and students’ epistemological background form their undergraduate/postgraduate education in terms of Science, Technology, Engineering and Maths (STEM). On other words, students with a STEM background did not have a significantly better attitude towards the use of data as part of their reflective practice when compared to those without a STEM background.
Correlational analysis of the attitudinal subscales.

In terms of how each subscale relate to one another, it is important to correlate those subscale that are theoretically related in terms of the Cognitive Belief domain (Perceived Relevance, Perceived Difficulty); the Affective State domain (Anxiety, Enjoyment) the Perceived Control domain (Self-Efficacy, Context Dependency) and the Affective Control domain (Anxiety v Self-Efficacy). Figures 2, 3, 4 and 5 show the scatterplots for the correlation subscales for each of the four attitudinal domains shown in Table 3 and 4. Table 3 and 4 summarises the proportion of Final year ITE Students per programme that fall within quartile 1, 2, 3 and 4 (Q1= High potentials; Q2= Promising; Q3= reluctant; Q4= indifferent respectively).

Statistical analysis indicates that there is a highly significant correlations for Context Dependency v Self Efficacy (the perceived control domain) within the three groups of ITE students [See Figure 2] (PGDE (P), F= 25.262, p<0.0001; PGDE (S), F= 65.647, p<0.0001 and BA4, F= 12.971 p= 0.001). However, findings indicate that there was no significant correlation between Anxiety v Enjoyment (the affective state domain) with PGDE (S) (F= 1.304, p=0.257) and BA4 (F= 1.009, p=0.320) participants but that there was a significant correlation between Anxiety v Enjoyment with PGDE (P) participants (F= 16.634, p<0.0001) [see Figure 4].

When we look more closely at the proportion of students within each quadrant of the correlational plots, we can see a shift in the proportion of students categorised as High Potential, Promising, Reluctant and Indifferent [see Table 3 and 4]. In terms of the Affective Control domain (Anxiety v Self-Efficacy) of student teachers attitude towards the use of data within their reflective practice, we see an increase in the proportion of students that are categorised as High Potential with PGDE (S) increasing by 6.4% (from 48% to 54.4% Pre v Post) and PGDE (P) students by 2.1% (from 37.9% to 40.0% Pre v Post). However, there is only a small increase in the proportion of BA4 students categorised as High Potential by 0.3% (from 38.6% to 36.9% Pre v Post).

By way of contrast, the proportion of PGDE (P) and BA4 students categorised as Promising increased by 16.6% (31.1% to 47.7% Pre v Post) and 17.7% (from 42.3% to 60.5% Pre v Post) respectively, while the proportion of PGDE (S) students categorised as Promising decreased by 0.5% (from 35.4% to 34.9% Pre v Post). What is pleasing to see in this data is the fact that when we look at the Pre v Post data, the majority of final year ITE students are in the High potential or Promising category. From Table 3 we see that 83.4% Pre v 89.3% Post of PGDE (S) students, with 69.0% Pre v 87.7% Post of PGDE (P) students, and 78.9% Pre v 97.4% Post of BA4 students being associated with the High Potential or Promising Categories for the Affective Control domain.

In terms of the final year ITE students responses in the Affective State domain (Anxiety v Enjoyment) we see a 3.1% increase in the proportion of PGDE (S) students within the High Potential category (from 35.7% to 38.8% Pre v Post). However, there is a 3.0% decrease (from 28.0% to 25.0%) in the proportion of PGDE (P) students’ categorised as High Potential with a 4.1% decrease in High potential BA4 students (from 26.6% to 22.5% Pre v Post). By way of contrast, there is an 2% decrease (from 20.4% to 18.4% Pre v Post) in the proportion of PGDE (S) students identified as Promising with a 2.1% increase (from 18.2% to 23.3% Pre v Post) in PGDE (P) students and a 7.2% increase (from 20.3% to 27.5% Pre v Post) in BA4 students being identified as Promising. However, there was also an increase in the number of PGDE (S) by 6.1% (from 20.4% to 26.5% Pre v Post), PGDE (P) by 8.0% (from 28.0% to 36.0% Pre v Post) with a 2.9% decrease (from 40.4% to 37.5% Pre v Post) in the proportion of BA4 students’ identified as reluctant.
When we look at the proportion of final year ITE students in the High Potential or Promising categories of the Affective State domain, we see that there is a shift in the proportion of students Pre v Post where only 56.1% of PGDE (S) students are in either category compared with 57.2% Post. This trend is followed by PGDE (P) students where only 46.2% Pre and 53.3% Post where in these categories. This trend continues with BA4 students as 46.9% of students where in both categories in the Pre sample and 50.0% in the Post sample. This findings may suggest that final year students do not overly enjoy the thought of working with data and indicates that ITE tutors might need to devise teaching sessions that contain a variety of activities designed to scaffold student teachers learning with regards to the analysis and interpretation of educationally relevant data.

In terms of the final year ITE students Perceived Control domain (Context Dependency v Self-Efficacy) we see an increase 7.3% in PGDE (S) students identified as High Potential (from 16.5% to 23.8% Pre v Post) with a 4.8% increase in PGDE (P) students (from 18.5% Pre and 23.3% Post) and a decrease by 11.0% (from 19.1% to 8.1% Pre v Post) in BA4 students identified as High potential. This is contrasted by a 2.0% decrease in the proportion of PGDE (S) students (from 61.5% to 59.5% Pre v Post), a reasonably increase (+10.1%) in PGDE (P) students (from 53.1% to 64.2% Pre v Post) and a larger increase (+19.1%) in BA4 students (from 64.7% to 83.8% Pre v Post) identified as Promising. What is particularly interesting about this data is that when we compare the proportion of students Pre v Post for the Perceived Control domain in the High Potential and Promising categories, there a proportionate increase in students in these categories. For example, 78.0% PGDE (S) Pre v 83.3% Post, with 71.8% of PGDE (P) Pre v 87.5% Post and 83.8% of BA4 students Pre v 91.9% Post identified as either Promising of High Potential.

There are three messages that emerge from this data. First, it is encouraging from an educational perspective to see that the majority of students sit within the High Potential and Promising categories in terms of the Affective Control and Perceived Control domains. Second, there is good evidence that student teachers’ perceptions of Affective Control and Perceived Control can be improved in terms of their state of anxiety, self-efficacy and context dependency. Third, the students’ level of perceived enjoyment (relating to their use of data within their reflective practice) is low.

In terms of the Cognitive Belief domain of final Year ITE student teachers’ attitude towards using data within their reflective practice, as stated previously, there is a significant decrease in PGDE (S) students responses in the Post questionnaire in relation to the Difficulty, Relevance Data Effectiveness for Pedagogy and Intention to Use Data subscales (Mann-Whitney U-Test Pre v Post, p=0.001), while there was a significant increase in BA4 students response to the Post questionnaire on the Context Dependency, Difficulty, Relevance, Data Effectiveness for Pedagogy and Intention to Use Data subscales subscale (Mann-Whitney U-Test Pre v Post, p=0.04). When we look at the correlational analysis of the Difficulty and Relevance subscales for the final year ITE students we see a 9.3% increase (from 23.3% to 32.6% Pre v Post) in the proportion of PGDE (S) identified as High Potential whereas there was a 10.0% decrease (from 24.0% to 14.0% Pre v Post) in PGDE (P) and a 9.3% decrease (from 26.0 to 16.7% Pre v Post) in BA4 students identified as High Potential. In terms of the Promising category there was a 14.1% decrease in PGDE (S) students (from 68.5% to 54.4% Pre v Post), a 16.4% increase in PGDE (P) students (from 60.8% to 77.2% Pre v Post) and a 19.5% increase in BA4 students (from 63.8% to 83.3% Pre v Post) identified as Promising. This data indicated that there is a shift in the proportion of PGDE (P) and BA4 students to Promising from High Potential and a shift in the opposite direction for PGDE (S) students from Promising to High Potential.
Table 3: Percentage distribution of final year ITE student’s that identify as having a High Potential, Promising, Reluctant and indifferent attitude towards the use of data within their reflections in the Affective Control and Affective State domains.

Q1= High potentials; Q2= Promising; Q3= reluctant; Q4= indifferent.
Data analysis and interpretation activity findings
As previously stated in the methodological approach section, the data presented for the Data analysis and interpretation activity outlines the findings for PGDE (S), PGDE (P) and BA4 students. The analysis will first present the overall distribution of scores from the activity to assess the construct and face validity of the instrument used. Second, the findings in terms of mean scores for PGDE (S), PGDE (P) and BA4 will be described. Third, we look specifically at the classroom level data in terms of how the students answered each groups of questions in order to highlight some of the emergent issues.

Distribution data for the research instrument.
The data analysis and interpretation activity involved the PGDE (S) and BA4 students answering 12 individual questions grouped around three themes (1) classroom level tracking and monitoring assessment data [(Q1a to 1d(iii) worth a total of 32 points], (2) School to virtual comparator data [Q2 worth a total of 6 points]. And (3) School to National trend data using SIMD deciles [Q3 worth a total of 5 points]. The maximum number of points available for this activity was 43. Figure 6 shows the frequency distribution of scores for the activity.

Figure 6: Frequency distribution for the data analysis and interpretation activity scores

The data presented in Figure 6 indicates that frequency of scores for the PGDE(S) and PGDE (P) is normally distributed. However, the frequency of scores for the BA4 is skewed towards the lower score end of the graph. This suggests that there may have been some issues with the way the BA4 students viewed the activity and implies an issue with the construct validity of the activity items. This line of thought will be picked up later in the section that outline the student responses to each question in the activity.
Looking specifically at the mean scores focused only on the classroom level data within the activity we see that the BA4 students’ score significantly less well in comparison to PGDE (S) and PGDE (P) students.

**Figure 7**: Classroom level data scores for the data analysis and interpretation activity.

![Bar chart showing mean scores for PGDE (S), PGDE (P), and BA4 students. The error bars reflect the standard deviation from the mean. The red bracket relates to the comparison of PGDE (S) verses BA4 mean scores using a Mann-Whitney test. Table 5 shows that PGDE (S) mean score (± Standard deviation) for the activity was 51.0% ± 10.2%. The PGDE (P) mean score for the activity was 49.4% ± 8.6 and the BA4 total mean score for the activity was 39.0% ± 10.7%. There is a strong statistical different (Mann-Whitney U-Test p<0.0001) between the PGDE (S) and BA4 mean scores and the PGDE (P) and BA4 mean score. However, there was no significant difference between the PGDE (S) and PGDE (P) mean scores.

This data indicates that the PGDE(S), PGDE (P) and BA4 students could not fully analyse the data presented and in particular, the BA4 students struggled to make valid inferences from the data. The purpose of this activity was to explore how final year ITE students reason with and make meaning from educationally relevant data. Before we draw any conclusions from the summary statistics it is important to note which aspect of the activity the students found difficult. Table 6 contains the percentage distribution matrix for each item in the data analysis and interpretation activity.

When we look at the how the PGDE (S), PGDE (P) and BA4 students responded to Q1a parts i, ii, and iii it is evident that the PGDE (S) students understand and correctly attribute what type of transformation has to occur to make the data more meaningful since 26.5% could correctly state that presenting the data as an average would be useful with 44.1% of the PGDE (S) students could go further and suggest that by standardising the data it would make the test scores easier to compare across the five end of topic tests. In addition, 52.2% of PGDE (S) students could give three meaningful points from the raw data with 31.6% of PGDE (S) students able to give two meaningful points. Similarly, 21.1% of the PGDE (P) students could correctly state that presenting the data as averages would be useful with 40.0% could go further and suggest that by standardising the data it would make the test scores easier to compare across the five end of topic tests. In terms of making three meaningful points from the raw data, 45.3% of PGDE (P) students could do so with 45.3 % being able to make two meaningful points. However, 80.4% of BA4 students could not suggest what transformation was required to make the data more meaningful, with 19.1% being able to make the correct suggestion but did not explain why. By way of contrast 39.2% of BA4 students could extract three meaningful points of information from the raw data, with 45.1% being able to extract two point.
When we look at the data relating to Q1b (i – iii) we see that 16.2% of PGDE (S), 5.3% of PGDE (P) and 33.1% of BA4 students scored nothing for item Q1b (i) what information does this data provide regarding the attainment of the class? Only 2.2% of PGDE (S), 4.2% of PGDE (P) and 0.0% of BA4 students could score three points for this item with 60.3% of PGDE (S), 46.3% of PGDE (P) and only 9.8% of BA4 students able to score 2 point for this item. Whereas 21.3% of PGDE (S) and 44.3% of PGDE (P) students and 58.8% of BA students able to score 1 point for this item. Rather worryingly, 16.2% of PGDE (S), 5.3% of PGDE (P) and 31.4% of BA4 students could not score a point for this item.

For item Q1b (ii) which topic does the class understand best? 52.9% of PGDE (S), 53.7% of PGDE (P) and 64.7% of BA4 students could correctly identify the topic and give an explanation of for the choice, with 41.6% of PGDE (S), 42.1 of PGDE (P) and 33.3% of BA4 students unable to score a point for this item. It is interesting to note that the majority of those that scored zero for this item chose the wrong topic because they misunderstood the concept of standard deviation and many chose the topic which had the lower standard deviation rather than the one having the higher mean score.

By contrast for item Q1b (iii) which topic does the class understand the least? 77.9% of PGDE (S), 61.1% of PGDE (P), and 68.6% of BA4 students could identify the least understood topic and give an explanation for their choice. Whereas, 16.2% of PGDE (S),35.8% of PGDE (P), and 27.5% of BA4 students could not score any points for this item with the majority of incorrect answers being due to a misunderstanding of the concept of standard deviation.

Looking at students’ ability to identify the high and low attainers in the class, we find that for Item Q1c (i) which pupil is the highest attainer? 90.4% of PGDE (S) students, 97.9% of PGDE (P), and 88.3% of BA4 students can identify the highest attaining pupil and can give an explanation for that choice. We see a similar trend for item Q1c (ii) which pupil is the lowest attainer? With 87.5% of PGDE (S) students, 97.9% of PGDE (P) and 90.2% of BA4 students being able to correctly identify the lowest attaining pupil and give an explanation for their choice.

Looking at the data relating to item Q1d Reflecting upon the data in Table 2 [table on the activity worksheet], if this were your class, what does this data suggest about (i) pupils’ attainment? (ii) Your teaching? Only 2.9% of PGDE (S), 4.2% of PGDE (P), and 2.0% of BA4 students could give four points about pupil attainment from the data. However, 19.94% of PGDE (S) students, 20.0% of PGDE (P) and 9.8% of BA4 students could give 3 points and 22.8% of PGDE (S), 32.6% of PGDE (P), and 29.4% of BA4 students could give one point. Worryingly, 8.1% of PGDE (S), 1.1% of PGDE (P) and 41.2% of BA4 students could not give any points.
When we analysed the responses to item 1d (ii) we see that 19.1% of PGDE (S), 45.3% of PGDE (P) and only 5.8% of BA4 students to identify 3 points from the class data that they could make meaning about the teaching of the topics covered in the table, with 42.6% of PGDE (S), 26.3% of PGDE (P), and 27.5% of BA4 students could identify two point and 27.9% of PGDE (S), 16.8% of
PGDE (P) and 25.5% of BA4 students could identify 1 point. Disappointingly, 8.8% of PGDE (S), 1.1% PGDE (P) and 41.2% of BA4 students could not identify any meaningful point to make about the teaching of the topics. Figure 7 also gives examples of the types of response to item Q1d (ii).

Moving on to the analysis of the school level to national level data we found that for item Q2, only 2.9% of PGDE (S) students and 3.9% of BA4 students to make 5 meaningful points, with 18.4% of PGDE (S) students and 3.9% of BA4 students being able to identify 4 points. Also, 36.0% of PGDE (S) students and 2% of BA4 students were able to identify 3 points with 31.6% of PGDE (S) and 23.5% of BA4 students being able to identify 2 points. Whereas only 6.6% of PGDE (S) scores identified one or no points with 15.7% of BA4 students being able to only identify one point. What was surprising was that 51.0% of BA4 students could not analyse the graph and making any meaningful points. The PGDE (P) students were not asked Q2 and 3. The rationale for this decision was that as the data for the BA4 cohort suggests that the ecological and construct validity of these two questions was low.

When we analysed responses to item Q3 it was surprising to note that 98% of BA4 students did not even attempt to answer this item. Whereas 33.8% of PGDE (S) students could make three relevant points in response to this item, with 29.41% being able to make 2 points. Interestingly only 11.8% of PGDE (S) could make one point and 19.1% could not make any relevant points.

From an educational improvement perspective, these findings suggest a high proportion of the three groups of final year ITE students struggle to adequately analyse and make meaning from classroom level tracking and monitoring data. With PGDE (S) students being marginally better than PGDE (P) students at making meaning from the data with BA4 students scoring poorly when it comes to classroom level data interpretation. This suggests that despite these students having a mainly positive attitude in terms of being High Potential or Promising across the Cognitive Belief and Affective Control domains of attitude towards the use of data within their reflective practice, as evidence from the Pre and Post questionnaire data, that there is a gap between their perception and their ability to use data to ground their professional judgement.

What was clear from these findings is that the BA4 primary education students could not bring their own Numeracy skills to bear on this simple data set. Data handling and analysis is a key aspect of the Numeracy Experiences and Outcome (E&Os) and is an important aspect of the Mathematics for Understanding element of the BA (Hons) Primary Education programme but when the data is contextualised within a school context i.e. a class set of end-of-topic assessments, they are not able to apply the knowledge and skills that they have learned within this activity. What is more worrying is that these BA4 students would be expected to teach data handling and analysis as part of numeracy lessons going forward into the Teacher Induction Scheme (TIS). Likewise for the PGDE (S) and PGDE (P) students, these findings provide stark evidence that both groups of final year ITE students are not able to effectively handle educationally relevant data to drive forward data-informed reflection of pupils ‘attainment or their own teaching practice.

Note: - no data
When we look specifically at the epistemological background of the PGDE (S) and PGDE (P) students of 136 PGDE (S) students that participated in the data analysis and interpretation task, 81 students have a STEM background from their undergraduate or postgraduate education with 55 students with a Non STEM background from their undergraduate or postgraduate education. Of the 95 PGDE (P) students that participated in the data analysis and interpretation task, 9 had a STEM background from their undergraduate or postgraduate education with 86 having a Non STEM background.

When we analysed the data by comparing PGDE students ability to analyse the classroom level data with reference to the students STEM or Non STEM background, we found no statistical difference between PGDE students in terms of their STEM background ($t= 0.229$ df = 89.0 $p=0.819$)

**Table 7:** Comparison of PGDE Students’ ability to analyse, interpret and make meaning from classroom level data by STEM background.

It is interesting to note this finding given that we also found that STEM background did not significantly affect student teachers attitude towards using data within their reflective practice.

**Qualitative analysis**

**Final year ITE students’ reflective practice.**

In this section, we will outline the preliminary findings of the analysis of the final year student teachers lesson plans, evaluations and reflections from each teaching placement sequentially and in summary.

**Lesson evaluation and reflections from teaching placement one.**

Analysis of the student teachers lesson plans, evaluations and reflections for teaching placement one indicates that there is a large variation within the student teachers reflections on practice over the course of placement one. In general, the lesson reflections were poor quality in terms of content and context description and shows that these students’ lacked perception, awareness, attention and focus in terms of the general purpose of the reflections i.e. the incremental improvement of teaching practice.
When compared to my explanations and questions from the last lesson and this lesson, I think I have improved, as the responses from the class were quicker and more detailed. I dealt with the low-level disruptions well by firstly reminding the class of what they should be doing before targeting individuals. The next time I teach this class, I will focus on asking individuals that avoid questions and also directing different levels of question to different members of the class to meet their abilities PGDE (S) 4 (TP1).

I was reasonably effective during this lesson, however my tone and lesson organisation needed improvement PGDE (S) 1 (TP1).

I feel the students achieved most of the desired learning although they did not complete the experiment. We ran out of time to carry out the room temperature experiment. The students were mostly competent carrying out the experiment although they needed a lot of guidance PGDE (S) 5 (TP1).

The above examples support the notion that these students struggle to sufficiently articulate their thoughts on their practice. In addition, 41 out of the 64 students struggled to generate sufficient depth within their reflections to make any quality judgements about pupils’ learning or their own developing pedagogical practice. Most reflections focused upon describing issues such as managing and dealing appropriately with pupil behaviour within lessons rather than on whether learning occurred for pupils. Also, while the student teachers could identify aspects of practice that requires improvement, most of them struggled to offer suggestions on appropriate next steps for improving their teaching practice. In terms of evidence used to justify claims, PGDE 4 hints at the use of formative assessment using questioning however as we looked more closely at the range of reflections submitted, the students draw on quite an narrow range of formative assessment techniques in placement one.

In terms of the heuristic of professional judgement within the teaching placement one reflections, most students managed to reflect, to varying degrees, upon advice given by school-based mentors and other teachers but did not go into sufficient detail within their reflections in terms of what that advice was or how they proposed to act on that advice. In so far as the number time individual students mention such advice, they tend to mention other teachers only once or twice within their reflections.

Following discussions with the class teacher, I will now ensure I set out experimental equipment before the start of school each day and have the associated PowerPoint’s loaded on the computer ready for the start of the day PGDE (S) 5 (TP1).

After discussing the feedback received from the classroom teacher with my mentor, in future, I will start the recap slide by asking questions on states of matter first, and then build on this. I will set up questions to make it clearer what kind of response I am looking for PGDE (S) 7 (TP1).

The reflections also indicated some awareness of the need to read policy and curriculum based literature but in a non-specific manner. However, none of the students explicitly or implicitly drew on their wider professional reading nor could they relate theory learnt on campus to their developing teaching practice.

The resources I will use in order to keep my delivery variable will be from “Science Formative Assessment: 75 Practical Strategies for Linking assessment, instruction and learning” by Page
Keeley. I feel this book has helped me hugely with a number of ideas for the classroom PGDE (S) 12 (TP1).

The ability to draw on wider professional reading is an important aspect of professional reflection that is taught within the PGDE (S) programme prior to teaching placement one but these findings indicate that after placement one, the students require more support within this aspect of professional reflection to help them to make better use of their wider professional reading.

*Lesson evaluation and reflections from teaching placement two.*

Analysis of the student teachers’ lesson plans for teaching placement two indicates that there was a modest improvement in the quality of reflections in terms of their depth of description and detail in terms of context and content. In addition, the student teachers made a greater effort to evaluate their lessons effectiveness relative to the stated learning objective for the lesson.

In terms of learning objectives 1 and 2 pupils were able to answer the questions posed by me throughout the lesson. They all had a note in their jotters of the correct answers to the written questions therefore when the time comes to revise, a model answer will be there for them. Pupils all seemed to be able to answer the closed questions posed but when questioned using some examples from Bloom’s that promote more in-depth and higher order thinking, many of the students could not apply their knowledge.

LO1: All pupils successfully managed to subculture bacteria from a solid to a liquid using aseptic technique. The inoculating loops were sterilised correctly, removal of the inoculum and the inoculation method were satisfactory.

However, what these examples show is that student teachers evaluations still focus on generalities in terms of pupil learning. With regards to how the students use their understanding of their pupils learning to reflect upon their pedagogical effectiveness, students’ struggle to relate their growing knowledge of their pupils learning to make sound judgements about their teaching practice. For example, when PGDE (S) 8 and PGDE (S) 9 reflecting upon their teaching practice in relation to the above evaluation they wrote

Overall, decent first lesson. Pupils very quiet but supporting teacher made comment on my good use of questioning albeit pupils were reluctant to take part. This may be due to the fact I am a new teacher. The supporting teacher suggests that my link to prior learning was good, the film-clips worked well with this class but ask them to answer specific questions using the video.

In this lesson, I provided a safe and well-organised environment for all pupils (SPR 3.2.1). I reiterated health and safety expectations within the laboratory, for example, wearing the appropriate PPE (Lab coats). I carried out a demonstration at the start of the lesson, showing how the experiment should be done safely. I also lit each pupil’s Bunsen burner individually using a lighter, as the torch lighters were not working. Throughout the practical, I circulated around the room to check that pupils were following instructions and also to provide any assistance if required. I used a mixture of interesting facts about microorganisms (bullet points) and video-clips on microbial disease to sustain the interest of all learners (SPR 3.1.2). I also tried to get the learners involved by asking them [the pupils] questions, for example, what do they think the top cause of death is worldwide?

These example shows that these students did not make a connections between their evaluations of pupils learning, relative to the stated learning objectives for the lesson, nor do they explicitly...
relate how effective their teaching was in relation to the lesson taught or how they know that learning actually occurred. Worryingly from an ITE tutors perspective is the fact that these students did not make reference to their use of formative assessment techniques beyond questioning as a source of evidence for their reflections. In the case of PGDE (S) 8 they seem to rely heavily on the advice of the observing teacher as opposed to how they perceived the lesson. This is a theme that was prevalent across most of PGDE (S) 8s lesson reflections during teaching placement 2. It is important to note that depending on the school-based mentors approach some student teacher may be more controlled than others to the point where their reflections become stifled.

In the case of PGDE (S) 9, this student made an attempt to relate their reflection to the GTCS standard for registration. However, on closer inspection of the reflective account it is clear that this student has used the wording of the SPR to frame their claims but provides no clues as to how they used the SPR to benchmark what they are doing within their class practice in terms of content, context and analysis of practice. Neither does this example give an indication as to how the student is using the SPR to assess the effectiveness of their practice. This example is typical of the way in which students apply the SPR to support how they are meeting the standard in a superficial way. Incidentally, level of reflection within these students teaching file resulted in an unsatisfactory grade when assessed by the science subject tutor during their classroom observation.

**Lesson evaluation and reflections from teaching placement three.**

In general terms, the lesson evaluation and reflections from students across teaching placement three were in many respects qualitatively more detailed than those from teaching placement two in that while they were still descriptive, the depth of detail had increased and there was a marked increase in the number of reflections which contained knowledge claims backed up by evidence. This finding was supported by the statistical analysis of the number of time a code is mentioned by a student within their written reflections.

Unfortunately, few student teachers could draw upon literature to support their reflections and of those that did, they did so in a piecemeal and unsystematic way, and in a non-specific manner.

> I am currently reading ‘the craft of the classroom by Michael Marland and the chapter ‘Records and Registers’. In this it describes keeping records of work that have been completed by students. This way I will be able to see who needs to get caught up on what specific works. **PGDE (S) 13 (TP3)**

From the example above, we can see that (for this student at least) they do not develop the context for using the cited text to any extent. This student also does not identify how they intend to use the text or what the potential impact on their practice might be. This lack of specificity is a feature of the reflections across all three teaching placements.

In terms of reflections upon policy, the student teachers tended to focus heavily on the GTCS Standard for Registration (2012), which is understandable given that this particular policy document is at forefront of their minds. What is rather strange is the fact that the student teachers only made fleeting reference to curricular documents such as the experiences and outcomes, the principles and practice document or the subject benchmarks and made no
reference at all to important curricular guidance documents such as subject documents from the Scottish Qualifications Authority (SQA).

**Quantitative analysis of reflections across the three teaching placements.**

When we perform a simple count of the number of times a code is assigned to participants reflections on lessons taught, relating to one of the elements of Gillies Heuristic of Professional Judgement we see that in teaching placement one, the student teachers make statements about their practice without backing up their claims with supporting evidence. This trend continues throughout the written reflections over teaching placement two and three (no significant difference between TP1, 2 and 3). However, over the course of the three teaching placements, the average number of statements that have supporting evidence increases significantly between teaching placement 1 and 3 (p=0.011) within the student teachers lesson reflections.

As shown in Figure 10, in the overarching themes of others - peers, partners and pupils as a source of information for reflection are barely, if even mentioned by the student teachers within their written lesson evaluations and reflections. However, the student teachers do mention taking advice from their mentors and other teachers within their written reflections as highlighted above.

**Figure 10:** Median number of mentions per theme within Gillies (2016) Heuristic of Professional Judgement.
Student teachers focus and attention when reflecting on teaching.

Our findings suggest that the PGDE (S) student teachers in this research focus on describing classroom experiences by attending to issues of classroom organisation and management, dealing with pupil behaviour and the mechanics of their lessons. What is more disconcerting from an ITE tutors perspective is that these students tend to make a lot of claims within their reflective writing that they do not back up with evidence. As Figure 10 indicates, the median number of claims without supporting evidence remains constant over the three teaching placements. However, what is more encouraging is that the median number of claims within the reflections increases significantly from 6 to 11 between teaching placement 1 and 3, which suggests that the students are responding to the advice given by their ITE tutors regarding this aspect of their reflections and that the students are improving their ability to evidence their claims.

Figure 10 also indicates that the student teachers were able to recognise aspects of their practice that needed improvement - mainly issues to do with the mechanics of the lesson, classroom organisation & management and dealing with pupil behaviour. From the perspective of improving classroom practice, the fact that students’ are able to identify next steps for pupils’ learning and their teaching practice across reflections from all three teaching placements was encouraging. However, there was no specific detail within these reflections as to how the student identified next steps would be taken forward in terms of actions nor was there any discussion as to how they might draw on their wider professional reading to support those next steps.

What was striking was the lack of focus on and use of the literature - pedagogical research, reports, policy and curricular guidance documents within students’ reflections. This is an odd finding since our students are regularly exposed to a large range of different types of research, policy and curricular literature within all of the teaching sessions while on-campus. This may suggest that the students do not know how best to integrate their wider professional reading into their lesson evaluations and reflections on teaching or the simply do not see this as important. We would suggest that both scenarios may be true and that this could be an indicator of the theory practice gap.

Quality of student teachers reflective practice.

A recurring theme from the analysis of students’ written reflections across all three teaching placements was their descriptive nature. This is unsurprising since the students were strongly encouraged to use Gibbs (1988) model of reflection which is a staged approach to written reflection that encourages students first to describe the lesson in terms of context and content, highlighting critical incidents that occurred within the lesson. Second, it encourages them to reflect upon their feeling about the experience and to explore their professional values. Third, the students are encouraged to evaluate what was good or bad about the experience and how they know. Fourth, students then analyse the lesson to see what sense they can make from the situation relative to their professional reading. Fifth, they are then asked to draw tentative conclusions about the experience and to consider what else they could have done. Finally, they are then encouraged to identify next steps or actions.

It could be argued that this model of reflection represents a techno-rational approach to professional reflection but we suggest that at least this model provides a starting point for student teachers that supports their engagement with the complexities of professional reflection. It also acts as a framework that provides prompts that helps their reflective writing. Our findings suggest that despite having this model of reflection to support them, the quality and
depth of reflections, particularly those reflections from teaching placement one are poor, lack contextual detail and critically do not focus on the analysis of either their pupils learning or their developing teaching practice.

These findings lead us question the utility of Gibbs model of reflection as a way of supporting beginning teachers to develop their reflective practice. They also prompt us to reflect on how reflection is taught, supported and assessed as part of students’ initial teacher education. Kelsey and Hayes (2015) have suggested that while frameworks and models of reflection are useful for scaffolding reflective practices for students, they can also at times stifle creative thought and risk making the whole process an academic exercise thus failing to fulfil the purpose for which reflection was intended - improvement in practice.

Qualitative analysis of the lesson evaluation and reflections against the modified Gillies heuristic of reflective judgement indicates that there are a number of areas of the heuristic that this sample of student teachers struggle to engage with and others that they do not touch upon at all. For example, the students make no mention within their lesson evaluation and reflections of personal reading or principles and values [theme of Self]; peers or pupil feedback [theme of Others]; and Publications [theme of Literature]. However, they do touch on areas related to personal experience, with and without supporting evidence [Self]; Pedagogy and Policy [Literature]; and professionals [Others]. It is important to acknowledge at this point that the student teachers were exposed to the thinking that lies behind Gillies’ (2016) heuristic for reflective judgement in the reflective practice sessions of the PGDE (S) programme and as such it is not surprising that the students written reflections only touch on a few elements of his framework. That said, Gibbs (1988) model of reflection explicitly encourages students to reflect upon and to analyse their feelings; to relate the experience to their professional reading and plan actions, which will support improvements in practice. We suggest that there is sufficient alignment between Gibbs model of reflection and Gillies’ (2016) heuristic for reflective judgement to draw some useful conclusions regarding the quality of student teachers’ reflective practice. However, we need to also consider the impact of the act of assessing reflective practice on the quality of the writing within the students’ reflections.

For example, Moniz et al., (2015) investigating the assessment of reflective writing in medical students call into question the feasibility and utility of using reflective writing as an assessment tool in undergraduate medical education as they found that assessing students reflective writing was time consuming; that assessing a single piece of reflective writing did not predict performance on another; and that it took 14 pieces of reflective writing per student to obtain a stable measure of reflective writing performance. In addition, they suggest that the act of assessing reflective writing changes the nature of what and how the student writes their reflections in that they write to perform rather than to ‘reflect’. This is an interesting line of thought in that it suggests that the nature of reflective practice shifts from process to outcome since that act of assessment and the assignment of a grade (Satisfactory or Unsatisfactory) introduces the element of performativity to reflective practice.

Written reflections as a way of demonstrating student teachers knowing.

Our findings suggest that (for this sample of students at least) the main patterns of knowing drawn upon within the reflective writing are the personal and the aesthetic patterns of knowing. As previously stated, Carper (1978) suggests that the ‘personal’ is concerned with knowing, encountering and actualising of the concrete, individual self and the ‘aesthetic’ response is
always influenced by the person of the student teacher and the degree to which they are prepared to be engaged with their pupils. The knowing of self, in contrast to Gillies (2016) illustration of self, involves three inter-related components – (1) the perception of the individuals feelings and prejudices within the situation \[(related \text{ to the individuals 'frames of reference'}\]; (2) the management of the individuals feelings and prejudices in order to respond appropriately \[(management \text{ of behaviour within the situation}\]; and (3) the management of anxiety and sustaining the self (Johns, 1995).

In a number of student reflections they discuss issues with behaviour management of pupils; classroom organisation and interactions with other teachers but they never talk about their feelings or emotions within their reflections. This could be due to the fact that they are fully aware that their ITE tutor will view their reflections or their school-based mentor could ask to see them and therefore would not commit to writing such thoughts. What is interesting is that when observed during teaching practice, student teachers are able to articulate their thoughts, feelings and emotions during debriefing sessions with their ITE tutor. The research team has direct experience of supporting student teachers in this regard and in particular has interviewed a number of the student teachers within this sample and can affirm that these students are able to articulate other patterns of knowing, particularly the ethical and the socio-political. This suggests that we must be cautious when making judgements regarding how student teachers demonstrate their ways of knowing through classroom experience while on placement as their lack of discussion of their feelings and emotions within their reflective writing possibly demonstrates their growing socio-political awareness and their acute understanding of the power relationships that exist within the strictures of practicum and their developing professionalism.

The most pressing issue to emerge from this research is that most of the students sampled struggled to draw upon their wider professional reading within their reflection. This is not to say that they do not implicitly draw upon their wider professional reading within their teaching practice or within their reflective musings but that their use within the post-lesson evaluation and reflections does not capture this aspect of reflective practice very well. This may suggest that this skill requires both explicit instruction within ITE on how to integrate wider professional reading into written reflections and more practice. Also, this may indicate that this aspect of reflective practice might be as Meyer and Land (2003) suggest a threshold concept. Where a threshold concept is “akin to passing through a portal or conceptual gateway that opens up previously inaccessible way[s] of thinking about something” (Meyer and Land, 2003, p.1).

If we [as ITE tutors] are to support beginning teachers efforts to become better reflective practitioners, (as is required by the General Teaching Council of Scotland (2012) Standard for Registration) then the findings from this research provide some useful baseline data that direct our own professional reflections upon both the content and teaching of reflective practice within initial teacher education. These findings will also facilitate the construction of a more meaningful curricular experience for student teachers focused in this vital area of their professional education.
Semi-structured interviews

The findings from the semi-structured interview will be restricted to the analysis of student responses to the section one of the semi-structured interview schedule and will follow the pattern of outlining the views of the PGDE (S), PGDE (P) and BA4 students’ views together rather than separately for the sake of brevity. The data is very rich and complex and is subject to ongoing analysis. Section one was structured around a sequence of nine questions.

Section one - Students’ attitude towards the use of data

In this section students were asked what do you understand data to be? And would changing the term ‘data’ for ‘evidence’ be more helpful? If so, why?

The responses from the final year ITE students to these two questions is interesting as the responses range from basic statements to more nuances responses as seen in the following extracts from the interview transcripts.

Probably understand it to be like numbers, like gathering numbers from, I don’t know, if it was, like, an assessment or something like that, and then it’s then something that’s then turned into something to do something with it, put it into a chart, or that you want to find out something from the data, from what I’ve seen (PGDE S-1).

I would say assessments, like when you are taking all the marks and things and my teacher would always traffic light it and then put that into grids of like red, yellow and green (BA4-2).

Data is more than figures, hard figures, quantifiable. It is a variety of things such as observations (PGDE S-2)

My understanding of data is everything that we’re given in schools so all of the assessment records, all of the attendance records and basically every bit of information that we’re given that we use to help pupils whether we think it’s relevant or not (PGDE P-1).

Data is information collected in loads of different ways, whether that is through numbers or quantitative or qualitative, two types of data. Data as a students, I suppose is information that you are given when you are in... learning through modules. It is information that you need to take on boards and you can use it how you set fit and or what the purpose for it is (BA4-1)

Data is facts, figures, and observations in isolation. So, things that have been recorded somewhere that can be used in the future (PGDE S-4).

What we see from these responses is that data is construed as numbers or information by some students but as more than just numbers by others in terms of observations. When asked if switching the term data for evidence would be beneficial, the students were able to tease out the way they view evidence in more nuance terms. For example, all of the BA4 students agreed that the term evidence was more meaningful in comparison to data.

Yes, I think it would because as soon as you say data to people they think of Maths and if they are not strong in Maths, they get so scared that they don’t want to even think about it. Whereas evidence is a word that everyone uses, “you need to evidence their ability” you hear
everyone that is a teacher sat that. I have heard loads of teachers say “that [data] is really not my thing” like you do hear that quite a lot, so I think it would definitely change (BA4-4).

Yes because I think data sounds, well to myself it sounds very, as if it’s computerised, as if it’s all on technology. Whereas evidence is more personable, it’s stuff that you can see and stuff that you can use (PGDE P-1).

Evidence, I think is broader, evidence is getting towards information but not quite. So data is the recorded element in isolation, evidence is some context around the data, so this occurred in this set of circumstances, so that there is a level of justification that comes with the word evidence “I am using this as evidence because we are looking to evaluate students in a science class... This result was taken in a science class and we conducted the following activities or assessment” So evidence has more context around it than data (PGDE S-4).

As we can see from the extracts above, the term evidence has a linguistic quality that differs semantically from the word data in that it is seen to be more personable, less scary and provides more in the way of context than the term data. These findings indicate that these final year ITE students are more comfortable with the term evidence than data and that they view evidence in much broader terms.

This also relates to the finding that context dependency is a correlating factor with self-efficacy from the Pre and Post questionnaires, which highlights the complex nature of teaching and learning and that final year ITE students understand that context is required to make educational data more meaningful. The comment by BA4-6 regarding data as scary “as soon as you say data to people they think of Maths and if they are not strong in Maths, they get so scared that they don’t want to even think about it” is interesting as it suggests that the in-service primary teachers that they have encountered on placement are not comfortable using data and that perhaps in general, [pre-service and in-service teachers] ‘people’ are afraid of data, which is a theme that we will return to later in this section. In a number of the BA4 and PGDE (P) responses, the notion that data relates specifically to summative assessment appears and that a move towards the term evidence would be helpful.

I think it would take it away from summative assessment as well and make people think about qualitative data from formative assessment and kind of how children are coping with things throughout a topic or whatever. Rather than thinking about this massive thing that they need to do at the end of every block (BA4 -2)

Moving specifically to exploring the analysis of the questionnaire data, final year ITE students were asked what they thought was the reason for a high proportion of students reporting being anxious when using or reporting data to others. Again a range of views were expressed by students ranging from the view that they are inexperience and nervous towards being apprehensive about the correct way to use data.

I think it’s mostly inexperience. We’ve never done it before so it’s just kinda getting over the nerves and doing it for the first or second time. Making sure we’re kind of, that we’re not aware of what we should be doing and making sure we have an awareness of what we should be reporting back (PGDE P-1).
I feel that a weakness might be that the fact that when as a student teacher you think there is going to be some fall back on what you’ve done, like, if there is data there and it is in black and white, that they might be scared to speak or act upon that in case they have not took the message from it properly and they are worried that there will be some kind of comeback, whereas just having a discussion about somebodies performance, you just... its’ your own opinion but I think as a student you are kind of scared to use some kind of actual facts in case you are not using it appropriately (BA4-6)

I don’t know. I think it can be something that comes across as being quite scientific in a way, even although as you say, like, anything could be data, but...not anything, but you know what I mean, like you could gather data in many ways other than, but I think it comes across as being quite scientific and I suppose if you’re not from a science background, you might be worried about am I doing this right, is this wrong, is this enough, sort of idea... I think it’s to do with like, how you perceive your own ability to do that, rather than, I know that any time I see something that’s going to be data related, I’m a wee bit like, oh no, that’s gonna be a task. You know, rather than just be like, oh, just do this. (PGDE S-1).

It is interesting to note that BA4-6 is suggesting that some students may feel that is they use data incorrectly that there might be consequences, as evidence by the use of the phrase “some kind of comeback”. This gives a sense of apprehension and anxiety emerging from the improper or incorrect use of data. This could also indicate a creeping sense of high stakes remerging into primary schools that has not there before as a result of the introduction of the NIF and the imposition of the Scottish National Standardised Assessments at P1, P4 and P7.

The students were then asked to comment on why they thought a high proportion of students reported that they did not enjoy using or handling data. There was a clear sense among the BA4 students that the lack of enjoyment around the use of data was related to a lack of confidence in how best to use the data and a real sense of fear of how the data might be used against them.

I think it is the same as what I have just said, it is just fear. Its people worried that they are going to be wrong in how they use it, and I think it take somebody who’s confident and I think again it is like the Maths again, I think if you’re confident because I think it is like a mental block for some people, where as soon as you say the word data, like I’ve said if we change it to something else then they would probably feel fine if you said “using evidence to back up” because we do that all the time in university, where as in university yeah, we do some data stuff, mostly for dissertation but not a lot of it, so you feel it is something you know, you do it, it is just a different way of doing it (BA4-6)

**Interviewer:** You don’t realise that you know?

I think the other thing as well is if you’ve got data that says that a certain student or a group of students aren’t attaining to the level required that they are supposed to, you can kind of like blame yourself, that as a class teacher and think, what have I not done or equipped them with, in order for them to become successful. Whereas it could be something like an additional support need that is holding them back but when you see the data it really doesn’t take into account all these things. From what I know of, I don’t know if it does say that a student has an additional support need but from the data that I have had access to,
it is kind of one-sided almost so you can have a bit of fear as a class teacher that you are not doing everything that you can for those children (BA4-3).

What is clear from the extracts above is that the students are aware of the limitation of summative assessment data in terms of a lack of context. However, this also indicates that these students feel professionally responsible for the learning of their pupils and will need to be supported in the early stages of their career to use data, be confident and to understand the limitations of standardised data and what that data might say about their practice to others so that they see the benefit that having this data will have for both their pupils in the longer term, and for their professional judgement and their developing practice.

When the students were asked to comment on the finding that a relatively high proportion of students reported that they were not adequately prepared to use data within their teaching practice the responses were mixed in that some did not feel prepared and some did.

I think, I don’t think I realised how much data came into teaching before doing this course, but I think there’s been like a big focus on it, for me anyway, or like a big enough focus on it that you could then see why it’s important and probably how to do it in a way. So I don’t know. Yeah (PGDE S-1).

I don’t think we are. I think it is just because when you hear the word data, it’s the word choice. It sounds really big. Whereas day-to-day you’re doing your reflective practice of formative assessment and you kind of use that and it kind of is data but you think of data like test scores and then going from there forward which again we wouldn’t have had a chance to do properly since the short placement but ... yeah, I just think you don’t realise you’re doing it on a day to day basis (BA4-5).

I think we are adequately prepared to do it because university can only prepare you for those placements and we have to take into account how long those placements are and because of the word adequate, I think that we are not really going to get a chance to do that until we go out into our probation year and I don’t really see any loopholes around that unless we are provided with an external course that we can go on or something like that (BA4 -3).

However, BA4-6 did suggest that there was an issue with the timing of the placements which may limit some student teachers experience.

I would just like to add to what [BA4-3] was saying, when I was on placement, I did a May placement last year and there was a lot more data handling stuff happens in May because of the stage the children are at. They do all the tests at the end so I feel that was beneficial so I feel that, that is maybe when you’re saying we were adequately trained, so we may be better if we changed some placements like because we always see the same part of the year and if we got a chance to see, because that gave me a whole new development because when I was doing the form [questionnaire], I felt more comfortable with the use of data and how we evaluate, like I am also comfortable with Maths so it didn’t really affect me but I do feel that was a total difference, so when we are saying about weaknesses and inadequacies, I don’t feel them because of that placement and that was only a five week placement but I just feel in that five weeks I got a lot more of an experience than I had before (BA4-6).

The point to note here is the fact that this students experience, while on placement, was different from their peers in that they were in school during assessment time and therefore saw the
gathering and analysis of assessment data in context and had an experience that allowed them to contextualise at the practice level what they had been doing while on campus and in previous school placement experiences. In addition to this, a number of students made the point that they had many teaching sessions focused on the theory of how to handle data but wanted more focus on the practicalities of data handling and some workshops on how to do it.

I think we have many inputs on handling data but not so many practical activities that I can think of scenarios where, or workshops, where we are given statistics and we are told, you know, organise them or what are the next steps, it’s kind of more lecture based where we are kind of told how to do it but we are not really given those practical skills and I think for a lot of people it would be quite helpful to get the practical side of it as well as the theoretical side of it... I think it definitely shows the value of data because they talk quite a lot about the Scottish Attainment Challenge and all the relevant political theory and stuff behind it but as I say, just getting more practical knowledge about where we fit into that would be helpful (BA4-3).

The points made by students that there needs to be more emphasis placed on practical workshops focused on allowing them to analyse, interpret and make meaning from data will be taken forward by the UWS teaching team as from session 2021/22. The issue of preparedness is always a tricky problem for ITE given the crowded nature of the curriculum, especially in the PGDE programmes, but the timing of placements is a difficult issue to resolve without disrupting the placement system. However, there are plans to bring a focused activity to the school placement requirements for all ITE students in the coming academic session. This will attempt to resolve the issue of the theory-practice gap in relation to data handling in context.

When the students were asked what do you think the PGDE programme team can do to better support this? A number of suggestions can forth from the students ranging from more practical session on data handling to flagging up data literacy more in lectures. The quotes below sum up the feeling across all three student cohorts that there needs to be more smaller, more contextualised practical activities to support student teachers data handling and analysis skill development.

I think it needs to be flagged up more within lectures. So not just within school experience but within like literacy, numeracy and health and wellbeing. So I think all a’ them should have, even if it is just a half hour on this is the kinda data you might have, this is what you might have to do with it. And that way we’re not just getting one input, we’re getting like three or four kinda... (PGDE P-1)

I think in some ways maybe more like, I’m going to say this and it’s maybe not quite, but maybe some more, like, hands-on sort of tasks to do with it, like rather than just this is some data, and this is why data’s important, but actually doing some sort of activities related to it. And I know this is a subject studies assignment and that is hands-on to do with data, but I feel like, I mean, mine was maybe a wee bit different to what other peoples was, cause [sic] I had to cobble together some pretty rubbish data. It wasn’t very good. But I mean you’re still talking about it, so, but yeah, I think maybe like smaller tasks, like in smaller chunks, before doing that, maybe would help understanding a wee bit better (PGDE S-1).

The students were then asked to comment on the statement a large minority of students suggested that they neither agreed nor disagreed with the statement ‘Pupils benefit when
teachers use data to inform their teaching’. Student responses indicate a difference in interpretation of this question between the PGDE students and the BA4 students’ views.

For example, PGDE S-1 and PGDE P-1 suggested that if a teacher has data then they should use it to benefit pupils regardless of what that data says.

I feel like if you’ve got data and it shows that something’s either went well or it’s went badly then of course that’s gonna benefit the pupils, cause you’re either gonna still be teaching them effectively and they’re still gonna get out of it what you want them to get out of it, or you’re gonna change and then they’re gonna have more of a chance. So I don’t know why you would not have a position on that. I don’t know (PGDE S-1)

I’m not entirely sure because with myself, I would agree wi’ that statement. I think they do need tae use data tae like backup what the pupils are doing. And I think they need tae use data tae like inform their forward planning as well. So I wouldn’t agree with what the minority are saying (PGDE P-1).

Whereas the BA4 students’ responses suggested that this might have something to do with a lack of clarity as to what the data literacy questionnaire was asking them.

Again, it is due to a lack of clarity to what they thing they thought it [the questionnaire] meant. I think they will be aware, if it had a specific example, I think they would have been able to answer that better but because it was a general, again getting back to that fear of I am not sure what they are talking about so “I will hedge my bets” that I am not saying that it’s not because I don’t really know if it’s not and I am not saying that it is because it is more about the not knowing in answer to that question (BA4-6)

I think it can also be the fact that as we were saying that [BA4-6] and the timing of the placements that we are not really exposed to data handling as much in our placements that they can see the theoretical bit because we are told about it in university and they can go research that themselves. But they haven’t actually seen that in action. So, there is a kind of disconnect there where they know theoretically but they haven’t witnessed it so they put themselves in the middle because they don’t know how to effectively answer that question (BA4-4).

The next question in section one relates to the questionnaire findings was, a large minority of students reported that they neither agreed nor disagreed with the statements ‘I use data to form small groups of pupils for targeted support’ and ‘I use data to assign or reassign pupils to classes or groups’.

The example below from the BA4 interviews indicates that it is difficult for student teachers to alter class grouping.

I would say it is because as a student teacher, you have you’re groups laid out for you when you go into class, so sometimes it’s easier, especially in earlier placements, your teacher will say this groups are working on this and there because in previous placements I have had the kids working on completely different things. It’s not just different variations of the same learning intentions, so then you are just sort of given those groups and their working on and you plan accordingly for that. Then the bigger the responsibility you just go with it, and you don’t want to step on toes because you are in someone else’s classroom. But when we got into the higher responsibility of 100% of full class and we are in there longer, and in the school I have been in recently, they have been working on similar things so that’s when I have formed my own groups. For instance, I did Numeracy, Time that is kind of different from your
number work, so different children regardless of their groups have strengths and weaknesses in different area so I kind of did a what do you know already, and from there made groups from that and that kind of comes with more responsibility because in second year, I wouldn’t have thought I would be able to do that and change all the groups, change the classroom and the learning and the way they are used to it (BA4-3)

From the example above from BA4-3, the BA4 students construed this question as the student teachers ability or inability to use the data to alter groupings in the class. Whereas PGDE P-1 suggests that

Those students might be used tae having mixed ability within their school. Whereas I’ve always been used to a mix of both, mixed ability and groupings. So I’ve tended to use data for groupings... (PGDE P-1)

However, PGDE S-1 suggests that there is an element of apprehension bordering on fear.

I don’t know if sometimes when it comes to maybe like group work and things like that if people are a wee bit scared of how to do it, of like how they want to arrange pupils, and even if they looked at data, they still would, I don’t know if they would really use it properly to inform their decisions, like whether they would put people in groups based on their ability, or whether they would do it based on, like, well whether they’d do it based on ability and be like, either work with people of a similar ability or whether they would do it mixed ability, and I think even looking at data, they might still be a wee bit unsure of what the best thing to do was in certain scenarios (PGDE S-1).

Contextualising the use of educational data - Two professional scenarios.

Scenario 1

As a research team, we recognised that we needed to support final year ITE students thinking on using data by helping them to situate and contextualise educational data use within their teaching practice. We therefore devised two professional scenarios to help them to situate educational data in terms of the who, what, when, where and why of using systematically gathered educational data as described on pages 22 and 23 of this report.

In relation to professional scenario 1, You are preparing for a parent’s night to discuss pupil progress with parents, (a) What data would you take along to that meeting? Thematic analysis of the PGDE (S) and PGDE (P) student responses suggests that when preparing to discuss pupils’ progress at a parent’s night, both PGDE (S) and PGDE (P) students would gather data/evidence around four themes – (1) Attainment/Achievement evidence; (2) Examples of pupils work; (3) Context for learning information; and (4) Wellbeing related information. Table 8 contains an outline of the types of evidence that PGDE (S) and PGDE (P) students mentioned in their responses.
Table 8: Outline of the types of evidence that final year ITE students would gather to direct discussions at a parents/caregivers.

</table>

The following extracts from the PGDE (S) and PGDE (P) student responses give a sense of the types of data they would bring to the meeting with parents in context.

I would take along the following data
- Summative results: Up to date scores and reports from tests and assessments.
- Formative results: Feedback from tests, examples of classwork (highlighting positive features and areas of development.)
- An example of art, free-writing, personal project for the parent to view.
- Examples of performance in P.E, drama, HWB.
- Examples of class-room behaviour and interaction with other pupils. Bring a record of achievement, good/ challenging behaviour records.
- Any additional resources to provide support at home. (PGDE P-1)

I would take along information from summative assessments in literacy and numeracy. Taking along examples of the pupil’s work would also provide evidence of their child’s achievement. I would also refer to formative assessment that I have obtained, including notes about each child. If their school report had been sent out prior to the meeting I would take that along too. I would also take along information about attendance, if this was a concern. (PGDE P-36)

I would take class test data, attendance records, homework task scores, any marked assignments, and any completed marked activities undergone. These would all be converted into percentages to compare against the class average, to show if there has
been any improvement/drops in grades, predicted grades which are backed with this evidence etc. I would also have a note of each pupil’s level of participation in lessons, their social interaction in group work, their overall ability to work independently. (PGDE S-9)

I would take an example of work that the pupil has done particularly well in, as well as a piece that they might have struggled in. This provides evidence, if required to show parents areas which pupils might struggle with and require additional assistance, either in school or at home. In addition to this evidence, I would take the record of pupil progress throughout the year, based on summative assessments such as class tests and homework. I would also have a record of attendance, homework hand-ins/task completions and any behavioural issues I may have with the pupil. A preliminary report card may also be useful to indicate a pupils social interaction, participation in lessons and practical work ability in groups or independently. (PGDE S-62)

When we look closely at the findings in Table 8 and the examples above we can see that Summative assessment evidence is at the forefront of the PGDE (S) and PGDE (P) students minds when preparing for the parental meetings with 89.1% of PGDE (S) and 94.1% of PGDE (P) students indicating that they would take this type of data along, while only 20.3% of PGDE (S) and 23.5% of PGDE (P) students specifically mentioning that they would take formative assessment evidence along. There is also a difference between PGDE (S) and PGDE (P) students mentioning that they would take homework scores along with 37.5% of PGDE (S) and only 7.8% of PGDE (P) students mentioning they would take homework scores along to the meeting. This perhaps suggests that PGDE (S) students value homework more as a form of evidence than PGDE (P) students. This is contracted by the fact that 23.4% of PGDE (S) and 19.6% of PGDE (P) students said they would take examples of pupils’ homework to the meeting. Interestingly, only 7.8% of PGDE (S) students compared to 27.4% of PGDE (P) students mentioned taking along their classroom observation notes to the meeting.

In relation to scenario 1 question (b) how might you use the data available to you to steer the discussion with a child’s parent or care-giver? We see a number of themes emerge from the way both PGDE (S) and PGDE (P) students reflect on this question.

Both the PGDE (S) and PGDE (P) students’ responses follow a similar pattern which places the child firmly at the centre of the discussion. Both sets of PGDE students identify the importance of orientation to the discussion. This theme relates to how the students would frame the discussion from begin to the end, and how they chose to emphasise key points from the data that they have gathered. The overwhelming majority of students suggest that they would begin with positive performance data by identifying strengths.

Ensure that my preparation for the meeting emphasises the positive elements of pupil’s learning/behaviour in the first instance. The data can be used to steer the conversation back, should the need arise, but should always begin with positive comments rather than negative. (PGDE P-4)

I would begin with discussing what I know about the pupil as a person and use the data to show positive aspects/areas of strength, then areas for improvement/of concern, any trends it may highlight, e.g. disconnect between classroom performance and attainment and then discuss strategies for this, then end by discussing a final area of positivity. (PGDE S-3)
The students then suggested that they would then turn to pupils’ work to show parents examples of the child’s areas of strengths.

The data is used to help give the parents/carers an understanding of the pupils’ progress to date. Evidence will be provided so the parents/carers can see the progression of the pupils learning throughout the topics and term. Once seen, the discussion could steer at the positives of pupils work, where their strengths lie, and showing evidence of this. And also to start discussion on where the learners’ challenges lie, how we are going to help improve this and how the parents can be actively involved in helping. (PGDE P-11)

By showing the pupils work (paintings/drawings/design work etc.) this allows you to discuss and highlight areas of strength and areas of development, linking to next steps for the pupil and highlight any support that may be required. After discussing the work, this is an opportunity to discuss other issues such as behaviour or absence and discuss ways that these issues are being dealt with and also things that parents/carers can support with at home. (PGDE S-21)

As the examples above suggest, there is an element of action to the discussion where the teacher would discuss next steps and support for the child.

In terms of the purpose of using data the examples below from PGDE S-41 and PGDE P-33 suggest that the data would be used to support the comments they were making. This also aids transparency and disclosure. The responses outlined below neatly sum up the combined responses to question (b) for both the PGDE (S) and PGDE (P) students

I would use the data to back up any comments on the pupil’s progress. I would discuss the areas that their child is doing well in first. I would show them examples of their work and their assessment results in these areas. I would then discuss areas that they have improved in and show them examples of their child’s work that show these improvements. Next, I would move the discussion onto any areas that the pupil is struggling with. If lack of attendance could be a contributing factor to the areas that the pupil is struggling with, I would use attendance records to highlight that this is a concern. I would discuss with the parents how I plan to support the pupil to improve their attainment in the areas that they are struggling. I would also provide details of the support that the pupil will be receiving, e.g. through support assistant or specific programmes. (PGDE S-41)

I would begin with discussing the positives to the parent/care-giver to show their child’s potential and strengths. I would then ensure any weaknesses or areas of development [that] I discuss with them is backed up with evidence so they can see where I have got the information from. I would then discuss with them what it is I am expecting from the pupil and discuss next steps with them. (PGDE P-33)

An emerging conceptualisation of how best to prepare and engage parent in discussions using the data available to them is outlined in Figure 9.
In relation to question (c) *How would you use the data to frame your comments to a parent or care-giver of a pupil who is making little progress overall or is struggling an area of the curriculum?* The data suggests that student teachers from both the PGDE (S) and PGDE (P) cohort agree that they ought to be used to frame the comments in a way that openly and honestly shows the child’s progress to date, areas of strength and development needs but with an emphasis on benchmarking, next steps and application.

I would use the data to offer a comparison to the rest of the class. If the rest of the class is doing well, the parent will be less likely to just blame the teacher for their child not making progress. If the pupil had not attempted homework’s, then this would be highlighted to the parents, and I would place an emphasis on the fact that the pupil must be willing to apply themselves if they want to progress. I would be asking the parents to ensure that any homework’s are complete in future and ask them to encourage their child to ask for help if they feel like they are struggling with the subject. *(PGDE S-16)*

Using the terminology ‘behind expectations’ allows the teacher to highlight what current expectations look like for the individual child and what steps should be taken in order to close the gap between ‘behind expectations’ and ‘meeting expectations’. I would outline to the parents, the data collected for their child in comparison with what my expectations would be according to the CfE benchmarks, age and stage of the pupil and, most importantly, any factors or barriers which directly impact on that specific child’s learning (for example, do they have a dyslexia or autism diagnosis? Have they undergone dyslexia screening in the school already?). It is important to be clear and specific when highlighting to parents which areas of the curriculum their child is struggling with (in addition to the positives) and what steps can be taken to provide support with learning and progress. *(PGDE P-16)*

What is interesting to note in the extract from PGDE P-16 is the focus on context, in terms of possible additional support needs. This was a common theme across both PGDE cohorts and is perhaps a function of the fact that both ITE programmes focus on inclusive pedagogy. What is also noteworthy in the response by PGDE S-16 to this question is the concept of comparison to the rest of the class. While we would argue that this is a valid thing to do, it also indicates a lack of experience of engaging in this type of discussion with parents. From the research teams collective experience, we have encountered a number of parents that have taken exception to
their child being compared to other children in the class. It also suggests that there is a need to discuss how best to approach such discussion as part of the students wider ITE experience.

In relation to question (d) *What would you say to the parent if they asked you what you intended to do to resolve any issue regarding their child’s progress that has arisen from the discussion?* Across both of the PGDE cohorts, student responses focus on partnership with parents and pupils. This takes the form of in class support which targets areas for development which would be monitored and reported back to both pupil and parent. However, the form of such support differs structurally between the PGDE (P) and PGDE (S) responses.

I would reassure the parents that I would use effective differentiation in the class to support their child to reach their full potential. I would provide the parents with support to help the child complete homework at home. I would communicate regularly with the parents to update them on their child’s progress in class and so they could update me on the child’s progress with homework. *(PGDE P-13)*

You could provide your plan for the pupil/class to the parent to reassure them of what you are hoping to achieve for the pupil. Outlining next steps in their learning is crucial, and getting the parents/caregiver on board with this will ensure that you have their backing and support. Trying to approach the situation as a team effort and asking parents to help it also important. As a teacher, we can provide additional time in lessons, after class or at lunch, and also indicate any homework clubs or support classes that might be running for the child to attend. Getting parents to check up on child doing homework etc. will ensure that they pupil is staying on task in school and at home. *(PGDE S-9)*

For example, the response by PGDE S-9 indicates that they would focus on aspects of support such as in class support such as target setting, close monitoring of progress and regular discussions with pupils about their progress with feedback to parents, in a similar way to that stated in the example from PGDE P13 above but with the addition of structured support beyond the classroom in the form of supported study at lunchtimes or after school, and extra revision lessons in the led into assessments. This highlights the difference in context between primary and secondary schools but it also indicates that both sets of PGDE students are committed to supporting children’s learning in a systematic, yet personal manner.

*Scenario 2*

In relation to professional scenario 2, which contextualises the use of data within a common scenario within many schools, that of a meeting between the class teacher and a principal teacher. The scenario was set out as follows - *You have been asked to attend meeting by your principal teacher to discuss your classes’ progress. Question (a) What evidence will you gather to help you support that discussion?* Data from the PGDE (S) and PGDE (P) student responses suggests some similarity in the types of evidence they would take to the meeting with the PT to that which they would take to a meeting with parents, with a few notable differences. Table 9 outlines the pattern of evidence that students would take to a meeting with the PT regarding class progress.
Table 9: Outline of the types of evidence that final year ITE students would gather to take to a discussion with their principal teacher to discuss class progress

The following extracts from the PGDE (S) and PGDE (P) student responses give a sense of the evidence they would take to the PT meeting about pupil progress in context.

I would take along data regarding class test attainment, marked homework scores, behaviour records, any record of formative assessment. For example, Microsoft forms, exit slips etc. I would also take any information on pupils with additional support needs and the alternative arrangements which have been of benefit to these pupils. I would also bring any sequence planning etc. to show what the class are currently working towards which shows any important dates such as; class tests etc. In addition to this I would also take any observation notes made during/after lessons on things like: participation, group work skills, confidence etc. (PGDE S-9)

I would have the results from all assessments prepared to show the level of attainment for each. I may well bring a record of the previous years’ results so that a comparison can be done. I’d prepare the scores so that it is providing information on trends for the class and pupils, and I would highlight any positive or negative outliers. I would also have behaviour and attendance records linked to assessment results so that they can be directly correlated. A diary of school events and occurrences could also be linked to identify any correlation. It may also be useful to identify any lessons or curriculum areas that have been adjusted since previous years, or are being trialled, so that a judgement could be discussed over the effectiveness of those changes. (PGDE S-58)

Very similar to parents evening-
- Recorded data of assessments- scores throughout the term to show the learners progression in the main curricular areas.
The attendance records to show pupils attendance to class and to see if there are any patterns arising.
- Jotters or work to the parent’s night. Comparisons perhaps, to detail areas of strengths and areas of development.
- Files on the pupil (FAB file) it was named on a previous placement
- Intervention files (if appropriate)
- HWB check-in (wellbeing webs)

Additionally, I would being medium term planner, future plans and E’s and O’s which have been covered and which are yet to be covered. (PGDE P-11)

If possible, I would bring along summative assessment scores from the previous year to show any progress year on year. This could also be useful in identifying any pupils where a pattern of under-achieving is evident or to help identify pupils who have shown a marked drop in overall performance. In the latter case, this could be a result of factors outside the classroom which may warrant further investigation. I would bring along evidence of success, such as IDL projects where pupils have worked collaboratively using their problem solving, creative and innovative thinking. Any evidence in line with GIRFEC should be used to demonstrate class progress. This could be something as simple as overall attendance figures which shows you have a class where pupils feel safe and included, for example. (PGDE P-24)

As indicated in the extract from PGDE P-11, both PGDE (S) and PGDE (P) students would take similar evidence along to the PT meeting as they would to the parents meeting. However, there are some notable differences. First, 100% of PGDE (S) and 94.1% of PGDE (P) students indicated that they would take along summative assessment data. While only 28.6% of the PGDE (S) Students and 5.9% of the PGDE (P) students indicated that they would take along the class homework scores. Second, 56.9% of PGDE (P) students and 0.0% of PGDE (S) students said they would take their short, medium and long term plans to the meeting. This indicates a difference in the way planning, at the department and class level, happened within primary compared to secondary schools. Third, 41.2% of PGDE (P) students compared to 35.9% of PGDE (S) students indicated that they would take attendance records to the meeting while 40.6% of PGDE (S) students and only 15.7% of PGDE (P) students indicated that they would take along classroom behaviour data. This is surprising as poor behaviour and attendance are the largest contributing factor to lack of progress and poor attainment.

As we can see from the quotes from PGDE P-11 and PGDE P-24, there were several PGDE (P) students who mentioned health and wellbeing indicators with specific reference to the Safe, Healthy, Achieving, Nurtured, Active, Respected, Responsible, Included (SHANARRI) indicators of Getting it Right For Every Child (GIRFEC). While, none of the PGDE (S) students mentioned GIRFEC or SHANARRI specifically.

In relation to scenario 2 question (b) What are your feeling about the nature and direction of this discussion? Expand and explain any feelings by describing the feeling and why you might be feeling that way. Findings suggest that students naturally feel a combination of apprehension, nervousness, anxiety, worry and concern. However they also feel confident, open-minded responsive. Table 10 shows the relative percentage of times a feeling is mentioned in the PGDE student responses to scenario 2 question (b).

</table>

The following extracts from the PGDE (S) and PGDE (P) student responses give a sense of the feelings expressed in context.

This would depend on whether it is a routine meeting that all staff get/time of year. Even if routine it may well be intimidating in your first few years of teaching, if not always. Using this meeting as a positive and being open and sharing your ideas will help get feedback. I believe it is better to work with something and receive timely feedback instead of holistically at the end of the year. Thinking of why we do summative assessments with the pupils is key to engaging in a good mindset to improve and build upon current strengths. It also allows you to find out and work on your developmental areas whilst there is still time to improve. (PGDE P-6)

Whilst initially I may feel a little anxious about such a meeting I would welcome the opportunity to discuss progress within my class. I would hope the meeting confirms my own judgement of where pupil attainment is and help me to see what further steps I need to take to ensure full curriculum coverage. The support offered by colleagues is vital and would help my confidence as a newly qualified teacher. (PGDE P-15)

Overall, I would feel slightly anxious entering the meeting as if presenting data where every pupil within your class is not above the average. However, if you have data regarding homework submission, behaviour etc. you could use these alongside attainment to show that not all pupils are showing their full potential etc. By showing this data it will help me feel a bit more at ease as my principle teacher may have a clearer understanding of the reasons for each attainment record. I think by using your observations of the levels of participation, confidence and independence within the class to back up results would also be of use here. (PGDE S-9)
I would value a second opinion, especially regarding any practical work to make sure I am making fair and constructive comments and test results. I would expect a PT to take interest in my classes and this communication would be important for keeping the department standards the same and working together to offer suggestions on how to improve the classes’ progress. (PGDE S-33)

As we can see from the findings in Table 10 and from the examples above, there is a fair degree of nervousness and anxiety among the PGDE (S) and PGDE (P) students when asked how they would feel about being asked to attend a meeting with the PT to discuss their classes’ progress with 37.5% of PGDE (S) and 43.1% of PGDE (P) students mentioning that they would feel nervous and 18.8% of PGDE (S) and 21.6% of PGDE (P) students indicating that they would be anxious. This is contrasted by the finding that 21.9% of PGDE (S) and 23.5% of PGDE (P) students indicating that they would feel confident going into this meeting and that 31.5% of PGDE (S) students and 29.4% of PGDE (P) students would be open-minded within the meeting. The comments shown above also indicate that their feelings would be contingent on the nature and tone of the meeting. For example, whether the meeting was routine or ad hoc, whether there would be pressure brought to bear on them by the PT or not. Looking across the responses to this question from both sets of PGDE students, it is interesting to note that the level of confidence indicated comes from their use of the data brought to the meeting and their ability to explain and interpret that data within the context of the meeting.

When we take these findings into account with the findings from the classroom level data analysis and interpretation task, we would argue that this confidence might be somewhat misplaced, given the finding that 16.2% of PGDE (S) and 5.3% of PGDE (P) could not discern anything meaningful from tracking and monitoring data, while 41.6% of PGDE (S) and 42.1% of PGDE (P) students could not correctly identify which topic was best understood by the class and 16.2% of PGDE (S) and 35.8% of PGDE (P) students could not correctly identify the topic which was least well understood by the class according to the assessment data given. These findings taken together suggest that there is a need for teacher education to devise ways to contextualise the use of data within their teacher education programmes in an effort to better support students as they go forward into the profession. This is particularly important given that the new standards for provisional registration, which come into effect as of August 2021, places a specific emphasis on the students ability to employ assessment data and evaluate pupils progress within Standard 3.1.4 which we suggest focuses on data literacy as evidence in Table 11 below.

The addition of this standard to the new Standards for Provisional Registration highlight the significance of data literacy or more specifically, assessment literacy, within the policy discourse and we might further suggest that the new standards firmly aligns with the National Improvement Framework for Scotland and that initial teacher education providers will need to introduce more explicit teaching of how best to gather, analyse and interpret assessment data as part of their programmes of study that allow student teachers to meet this standard.
Table 11: Extract from the new GTCS Standards for Provision Registration (GTCS 2021)

In relation to scenario 2 question (c) How might you react if the PT shows concern that pupil progress in the class is falling below expectation? Think about how you might use all of the evidence available to you to add context to the situation and what idea might you bring forward to improve the situation? The data from the PGDE (S) and PGDE (P) student response suggests that both groups of students are equally open-minded and action oriented.

Table 12: Outlines the reaction to emerge from the PGDE (S) and PGDE (P) student responses to scenario 2 question (c).

</table>

The following extracts from the PGDE (S) and PGDE (P) student responses give a sense of their reactions as expressed in context.

I think I would try and defend my own teaching with collected data whether that be summative or formative assessment and show how collected data has informed practice however it is important to be true and honest and ask for feedback to implement to enhance the teaching and learning experience. I think progress reports will be useful in this instance.
to show the progress of the class and if some students are under-performing then plans and targets can be put in place. (PGDE S-19)

I would hope that I would be aware of the progress of pupils in the class, and have gauged whether they are falling behind. If the conversation has arisen because of a disagreement of where the pupils should be then I would have the evidence discussed in (a) above, but also have the plan for the remainder of the curriculum, including assessment point and consolidation/revision periods. In discussing the pupils’ attainments I would use the data on the assessment results and put forward my views on where they should be, and why they had achieved what was recorded. I might also ask for evidence from other departments to identify if pupil issues were across all areas or just my subject, this would let me identify if there was a specific issue with my teaching or if it was broader. If having presented my view the PT still had concerns I’d be asking for advice on where I should be and how I could move forward beyond what I had already planned. If there was criticism without advice on how to improve I’d take a note of that and add it to the evidence for further discussion which may occur, while seeking advice from other colleagues. (PGDE S-58)

I think it would be important to remain calm, and listen carefully to exactly what concerns the PT has about this pupil. It is important to acknowledge that I am aware of the situation, and provide the evidence which shows I have been tracking and monitoring the pupil’s progress to inform my planning. Assessment results would be useful here, especially those done periodically over time, so that I can show how I have established areas of concern and ones that require more support. Evidence of attendance or reasons for the pupil being out of class, if I believe this has been a major cause for the lack of progress. Explanations of what I have implemented so far to remedy the situation, for example engaging with parents and carers to ensure they are aware of the pupil’s progress and what I can do to help. (PGDE P-3)

If I am being completely honest, initially it would be feeling disheartened and disappointed in myself, I may even feel inadequate to be a teacher for a small period of time. However, as a teacher we have been trained to be continuously reflective. To learn that some things work and some don’t and to remember that each child is different and that they learn in different ways. I may use data of assessment to establish why this may be happening. I would then look at my teaching, how was the lesson planned, how was it delivered and what my reflection was on it. I would consider what needs to be adapted and differentiated, adopting a wider range of styles, and possibly look for support with my stage partner. (PGDE P-11)

When we look more closely at the findings in Table 12 and the comments above, we can see that the PGDE (P) students are less willing to use the available assessment evidence in the meeting with the PT than the PGDE (S) students as only 54.9% of PGDE (P) students mentions this in their responses compared to 71.9% of PGDE (S) students. Both groups are equally open-minded (18.8% PGDE (S) v 19.6% PGDE (P)) and action oriented (48.4% PGDE (S) v 49.0% PGDE (P)). This is in contrast to the finding that 29.4% of PGDE (P) students and 21.9% of PGDE (S) suggested that they would acknowledge their awareness of any issues with their classes’ performance as they would have already sufficient data to have identified any issue for themselves prior to any meeting with the PT. This point is made in the extract from PGDE S-58.
Conclusion
The conclusion section of this report is structured around the research questions posed by the research team to help meet the aims of the UWS project and the key finding from the quantitative and qualitative phases of the research.

RQ1. Do final year ITE students’ attitude towards the use of data differ according to programme of study?

Our findings indicate that there are significant differences in students’ attitude profiles towards the use of data as part of their professional reflective practice according to the programme of study taken on entry to teaching. Findings from the Pre and Post questionnaires suggest that a higher proportion of PGDE (S) and PGDE (P) students have high Self Efficacy and low Anxiety (the Affective Control domain) towards the use of data compared to BA4 students.

In terms of the Perceived Control domain of attitude towards the use of data, the Pre data shows that 16.5% of PGDE (S) students, 18.5% of PGDE (P) students and 19.1% of BA4 students identify as High Potential. Whereas, 64.7% of BA4 and 53.3% of PGDE (P) and 61.5% of PGDE (S) students identify as Promising in that they have High Self-Efficacy but also High Context Dependency. Statistical analysis suggests that the reliability of the questionnaire items is strong with Cronbach Alpha in excess of 0.8. However, we are not able to do any form of test for validity using explanatory or confirmatory factor analysis as part of this study but this will be undertaken in due course.

RQ2. What factors impact upon final year ITE students’ attitudes towards the use of data?

Correlational analysis of the attitudinal subscales within the Pre and Post questionnaire suggest that Context Dependency correlates significantly with Self-Efficacy and that Context Dependency is an important factor in determining attitude towards the intention to use data within final year ITE students’ reflective practice. In addition, our findings show that for PGDE (S) students, 72.3% Pre and 74.9% Post tend to totally disagree or are neutral towards enjoying using data compared with 82.5% Pre and 81.9% Post of PGDE (P) students and 82.7% Pre and 82.8% Post of BA4 students. From these findings it is possible to conclude that all three groups of final year ITE students do derive any great enjoyment from using or handling data.

Further statistical modelling is required to determine the relationship between the relative importance of the different elements of the theoretical model used to profile student teachers attitude towards the use of data to understand, make meaning and come to know their pupils and make professional judgements about teaching.

It is unsurprising that context dependency has emerging as an important element of final year ITE students’ attitude towards the use of data, given the social nature of both the learning process and the act of teaching. There are a host of complex social interactions and contextual factors within the school that impact on many activities relating to classroom practice.

Data from the professional scenarios added in session 20/21 indicates that PGDE (P) and PGDE (S) students are thinking and reflecting on how data would be used in context and indicates that there is further targeted support required to help student teachers understand how best to
handle educationally relevant data in different professional circumstances. This support will provide the context for both greater understanding of what such data has to offer student teachers in terms of useful information about their pupils learning as well as how the effectiveness or otherwise of their teaching was and how best to report the progress of their class/classes to principal teachers and senior leadership within the school. In addition to how best to engage parents and caregivers in dialogue about the progress (or otherwise) of their child.

**RQ3. Is it possible to improve final year ITE students’ attitudes towards the use of data, through focused teaching sessions?**

Our finding indicate that it is possible to make modest shifts towards improving ITE students’ attitude towards the use of data within their teaching practice. However, just because attitudes can shift towards being more Promising and High Potential in terms of the Cognitive Belief, Affective State, Perceived Control and Affective Control domains of attitude, the ability to use data is a different prospect.

In terms of developing student teachers’ attitude towards using educationally relevant data is concerned, we suggest that ITE programmes needs to go further, by supporting final year ITE students to integrate what they have learned, particularly about the principles of assessment and how different types of assessment help teachers come to know, in terms of their growing knowledge of their pupils, and how they construe their practice within the realm of their developing pedagogical content knowledge. We suggest that by scaffolding this learning for final year students, they will come to understanding the potential benefits to them and their pupils of systematically gathering and analysing formative and summative assessment evidence, as well as the other contextual information that will enhance all pupils’ educational performance.

By grounding this work within the theory and practice of reflection, we suggest that final year ITE students might see for themselves that when they apply this learning while on school placements, they may get more from that experience when viewed from the perspective of how they come to know and make meaning from that classroom experience.

In this regard, the ITE programmes within UWS will endeavour to look more closely at how each programme explicitly supports the integration of educational theory, in particular assessment theory and practice, by asking students to more explicitly engage with different forms of data and other relevant evidence within their school experience placements in order to facilitate their development of awareness of the importance of being data literate and to support their growing pedagogical awareness as they ground their practice in more concrete forms of evidence.

**RQ4. To what extent can final year ITE students’ analyses and interpret educationally relevant data as part of their reflective practice.**

Our findings indicate that BA4 Students struggle to analyse educationally relevant data in a number of respects. BA4 students struggle to make full use of tracking and monitoring data relating to what that data has to say about pupils’ learning and what inferences they can take from the data to make comments about teaching.

In terms of the PGDE (S) students with a high Self-Efficacy and low Anxiety – those with highly positive attitude in the affective control domain – it is important to note that 40.1% of the sample
come from a STEM epistemological background, which we would argue is steeped in a tradition of data analysis and interpretation. Even these students struggled with the analysis of educationally relevant data. For example, while PGDE (S) students could making a number of meaningful points about how best to transform the data, and about what the data has to say in general about the attainment of the class, 41.6% of PGDE (S) students could not identify which topic was best understood. In common with BA4 students, the PGDE (P) and PGDE (S) students had issues with the concept of standard deviation. The data was presented to students in the form of a table with each column representing the class results for each end-of-topic test and each row representing the individual pupil results for the year, with mean and standard deviation for the each test and pupil.

It was clear from students’ explanations that both groups of students did not understand that standard deviation is a measure of the variance of the data, despite an explanation give for what standard deviation was being given on the activity sheet. This was particularly surprising given the predominance of PGDE (S) students with a STEM background. Our analysis of the Pre and Post questionnaires found that having a STEM background had no significant impact of attitude toward the analysis of data as part of their reflective practice.

Taken as a whole, when we analysed the data analysis and interpretation activity, our findings show that 56.7% of PGDE (S), 61.0% of PGDE (P) and 90.2% of BA4 students scored ≤50% which suggests that they could not effectively analyse educationally relevant data. When we look specifically at classroom level tracking and monitoring data, 52.2% of PGDE (S), 61.0% of PGDE (P) and 90.2% of BA4 students scored ≤ 50%, with 47.8% of PGDE (S), 39.0% of PGDE (P) students and only 9.8% of BA4 students able to score ≥ 51% in this activity. Even those students in PGDE (S), PGDE (P) and BA4 that score above ≥51% in the data analysis and interpretation task, struggled in terms of making simple observation about the data. This suggests that these final year ITE students need further support to engage in effective analysis and interpretation of classroom level data.

These findings also indicate that there is a need to present more authentic types of evidence to primary students. We believe that part of the issue with the PGDE (P) and BA4 students’ lack of ability to analyse the class level data, is possibly more a consequence of a lack of familiarity with that type of data presentation, which suggests an issue with the face, ecological and construct validity of the data analysis and interpretation activity for this group of ITE students.

**RQ 5 What type’s information/evidence/data do final year ITE students draw on as part of reflections on lessons taught during episodes of teaching practice?**

Our findings indicate that PGDE (S) students draw specifically on three lines of evidence within their reflective practice. The first being from observations made by class teachers and mentor. The second being from teacher directed activities such as formative assessment. The third being from pupil work such as homework and class activities that involve written responses. In many respects, these findings are is not surprising, but it is important to note that when it comes to the systematic and consistent gathering of evidence, the PGDE (S) students seemed to gather evidence more systematically in placement one. Again this is not surprising when you take into account that the PGDE (S) students have to do a small scale piece of professional enquiry into the validity and reliability of two formative assessment techniques as part of the placement to provide evidence for their subject studies assignment.
As they moved on to placement two, they were less likely to draw on a wide range of formative assessment technique as was apparent in the teaching placement one reflections. There was good evidence in the reflections that they rely heavily on oral questioning as a way to evidence pupils’ learning. In addition, these students did not seem to draw so much on that evidence in a critical way. Their reflections were too descriptive, lacked analysis and did not draw enough on wider professional reading to support their developing awareness of pupil learning or on how their classroom actions are developing as part of their teaching over the course of the placement. This was despite of explicit advice given to them by their placement tutors to draw more systematically on concrete forms of evidence and on their wider professional reading.

In many respects these findings parallel a range of research findings that look specifically into the way that student teachers engage with reflective practice. These findings also highlight the struggles to effectively operationalise professional reflection in a way that can be used to improve practice. We would suggest that these struggles sum up the tensions that student teachers experience as their awareness of issues that impact greatly on teaching practice grows over the year. These students experience a steep learning curve and the need to grapple with the complexity of reflective practice is part and parcel of the learning form experience element of the programme. Indeed, Jay and Johnston (2002) argue first, that “reflection” is an ambiguous term, that is difficult to conceptualise, where its use does not always connote a shared understanding. They suggest that it is important to outline how reflection is understood within the profession (i.e. teaching) for a more consistent understanding of the concept to emerge. Second, they suggest that the complexity of the concept of reflection can be difficult to articulate in a way that helps pre-service (student) teachers learn the skill, which has led to many technorational prescription that purport to support student teacher reflective practice. In an effort to scaffold student teachers reflective practice, we have to avoid falling into the technorational trap of providing a writing frame that narrows their reflection by reducing the complexity of everyday classroom practice, while at the same time helping them to focus their reflections on aspects that will be of benefit both to their pupils learning and to their own teaching practice.

To support student teachers in this regard, the research team aims to develop a reflective practice framework to help student teachers draw more systematically on a number of key area of teaching practice. This will provide ideas for how they can gather a range of data focused on pupils learning and other forms of evidence from the classroom context that might support their reflection. It will also attempt to scaffold their think about aspects of their classroom organisation and management to help students focus on the mechanics of the lesson and how they come to know that learning has occurred. In addition, we hope to suggest an approach that may help them to draw on their wider professional reading to better support their developing teaching practice at the technical, pedagogical and curricular level of classroom practice.

**RQ6 To what extent do final year ITE students use data to improve pupil’s learning and their teaching?**

Our preliminary findings from the PGDE (S) students’ reflections on lessons taught indicate that while the student teachers in our sample draw on a range of data and other forms of evidence to fulfil their goal of meeting the GTCS (2012) SFPR, they do not do so consistently. In many cases they rely too much on formative assessment and rarely draw on summative assessment. In this regard, we would like to offer a few words of caution when interpreting the finding relating to the written reflections. In addition, we would also like to offer some comment on what we
believe ITE might be able to do to better support ITE students to reflect better. Finally, we give make a few points that have come up as part of the semi-structured interviews conducted so far that might have a bearing on this research question.

First, we have only presented the findings for the PGDE (S) students that participated in the study and as such the findings presented relate only to this student group. We intend to draw on more PGDE (P) and BA4 students in the next academic session. Having said this it is clear that that PGDE (S) students’ reflective practice develops over successive teaching placements and that as they gain more teaching experience, their reflections qualitatively improve as they use more evidence to support their claims within their written reflections.

Second, it is not common for student teachers to explicitly reflect on summative assessment within their everyday reflections on teaching episodes, due in part to the fact that summative assessments such as end-of-topic test are generally not part of their everyday teaching. Summative assessments are designed to summaries the teaching and learning of that topic and as such provide data that once analysed and interpreted provides insight into pupils’ learning. Teaching of the topic leads pupils towards the assessment therefore one should only expect a student teacher to reflect on these after the assessment has been completed, marked and interpreted. However, given the fact that there is little evidence of such assessments being reflected upon by these students while on teaching practice, this does not suggest that such reflection has not occurred in other forms elsewhere while on placement. For example, during departmental meeting or in conversation with class teachers or during mentoring meetings.

Third, written reflections on lessons taught tend to be a demand that is placed on student teacher as formal requirement of their ITE programme and often fails to capture the many opportunities for reflection that occur with the school day. We would argue that the richness of such opportunities to reflect on practice are not adequately captured within written reflections. Also, as many practicing teachers will attest, it is rare for in-service teachers to be asked to keep reflective logs in the same manner that we expect student teacher to do. As consequence, it can be argued that written reflections tend to be narrow, descriptive accounts of episodes of practice which are given by student teachers as artefacts of performance (hoops to be jumped through) in order to be assessed a satisfactory or unsatisfactory by an ITE tutor.

We suggest that ITE programme staff need to think of more creative and find more innovative ways to capture reflection that does not privilege the written word as the only way that students evidence their ability to reflect. Given the complex nature of reflection, we ought to provide a range of media through which student teachers can capture their thoughts, feelings and understanding of what has happened during their teaching placements.

When we take these findings together with the findings from the data analysis and interpretation activity, it is clear that PGDE (S) and BA4 students are not able to make sufficient meaning from tracking and monitoring data and that it is likely that ITE tutors and school-based mentors need to work with students teachers to support and develop their awareness of the importance of such data and its utility as part of their professional knowledge base.

As part of the semi-structured interview schedule, we ask students questions that probe their experience while on teaching placement of the type of data they use when on placement, in what way was data used, and who used data the most in school. We also ask them questions to probe
what data they use on placement, how they use data while on placement, what was purpose did that data serve. In the responses to these questions it emerged that most students (sampled so far) make a clear distinction about what they consider data to be, and how they distinguish data from evidence. Of the PGDE (S) students interviewed, they all suggested that homework, end-of-topic and a range of formative assessment was the predominant evidence used by teachers but greater emphasis was placed on end-of-topic test results to track and monitor pupils’ progress. Whereas the PGDE (P) and BA4 students mentioned the use of SIMD data and standardised assessment data as well as formative assessment evidence being the most used form of data in school, particularly by their class teachers.

However, most of the primary education students claimed in their interviews that many classroom teachers did not feel comfortable sharing their classroom assessment evidence. In all of the interviews with the PGDE (P) students, they indicated that in their placement school, the head teacher used the data more than the class teachers and that the class teacher was held accountable for the trends in the data and that this produced a negative atmosphere around the use of data. Whereas the five BA4 students interviewed all described data, in particular assessment data, was used in different ways depending on the school culture. One BA4 student described a situation where the class teacher was reluctant to share the classroom level data with them and used that data to focus discussion during a parents evening with specific parents. In this description, the student suggested that the teacher did not feel comfortable discussing this data but did not disclose why except to suggest that the class teacher was very aware that such data said something about how the class was progressing and her teaching and felt very defensive about it.

Given this information, we would argue that student teachers are more aware of the rising prominence of educational data and its use in schools, perhaps as a consequence of the implementation of improvement plans under the auspices of educational policies such as the NIF, and that over time they will need to engage in a more focused way with such data, if they are to thrive within this changing educational environment.

Taking ideas forward

As a project team, we believe that it is important that we reflect on the findings reported here and disseminate the main messages that have emerge so far with our colleagues in Initial Teacher Education. In terms of what the UWS research team takes forward over the next two to three academic sessions, we feel that it is important from a research informed teaching perspective, that we split our efforts in two main direction...

- Improving the connection between on campus teaching and learning and school experience in terms of data literacy, and
- Development of a reflective practice framework.

First, we would like to acknowledge that by extend the research to recover the work that was disrupted by the onset of the COVID-19 pandemic, by adding to the sample described here in terms of completing the quantitative and qualitative elements of the research we were able to extend and firm up our analysis to publication quality. This will result in the production of research articles which will support the developing understanding of student teachers’ data literacy and inform our teaching and hopefully that of other initial teacher education institutions
across Scotland and the United Kingdom more widely. The addition of more participants to the data from the semi-structured interviews has added an explanatory elements to the descriptive data from the questionnaires and has brought an element of authenticity to our analyses by adding the student voice.

Second, in terms of the institutional element of the UWS research project, the findings from the data analysis and interpretation activity suggest that the data literacy workshops need to be extended and amended to make that activity more reflective of the types of classroom and school level to National level data that the different groups of final year students would be expected to interact with to make this activity more authentic. Emphasis will be placed on how this type of data can be used to direct improvements in learning and teaching. This will involve working in partnership with local authorities to design more authentic data sets for our students to work with. At present, we are collaborating with the South West

In particular, we will focus on how best to support the BA4 and PGDE (P) students to make full use of assessment evidence and to not rely too heavily on teacher directed formative assessment as their only source of evidence for learning. To this end, the research team will design a number of teaching sessions to help all ITE students (but particularly PGDE (P) and BA4 students) to understand the role and value that valid, authentic and learning-focused summative assessment has to play in informing their professional judgement. Since there was a strong feeling among the BA4 students that engaged in the data analysis and interpretation task that summative assessment was of limited utility to their understanding of pupils learning in the primary setting.

This view runs counter to the NIF and needs to be challenged in a professionally sensitive way. There was also a view expressed by many BA4 students during the data literacy teaching sessions that suggest the BA4 ideologically opposed to basing their professional judgement on summative assessment data. The research team will discuss this with the BA Education programme team and design teaching sessions that will support this group of students understanding of holistic forms of assessment and how they might use a range of assessments strategies to inform their reflective practice.

As part of our school experience modules across all ITE programmes at UWS, we will build in activities to the school placement file activities that will mandate the engagement with data in a collaborative way with their school-based mentors, in tasks focused on how teachers use different forms of classroom and school level evidence (data / information/evidence) to drive improvement in the educational outcomes for all pupils. We feel that this will help ITE students to make better connections between how practicing teacher use these lines of evidence (data / information) within their practice, and might also support efforts to develop a more professional attitude in our ITE students towards the use of data and other forms of evidence to inform their professional judgements and decisions as part of their reflective practice.

Third, the research team aims to design a reflection practice framework to better support final year ITE students’ with different forms of reflective practice. It is intended that this work will support the further development of a set of focused reflective questions designed to scaffold ITE students’ reflections and lesson evaluations. In addition, we will explore other ways that ITE students might evidence their reflection, for example a vlog (video log) or podcasts in order to help students to demonstrate their ability to reflect on lessons taught and school factors that might be relevant to the class context.
References

Appendix 1
Semi-structured Interview schedule

Section 1: Students’ attitude towards the use of data.

- What do you understand data to be?
- Would changing the term ‘data’ for ‘evidence’ be more helpful? If so, why?
- Analysis of the questionnaires so far suggests that there are a high proportion of students reporting being anxious when using or reporting data to others. Why do you think that might be the case?
- Likewise, a high proportion of students reported that they did not enjoy using or handling data, why do you think this was the case?
- A relatively high proportion of students reported that they were not adequately prepared to use data within their teaching practice. Why do you think this is the case?
- What do you think the PGDE programme team can do to better support this?
- In the questionnaires a large minority of students suggested that they neither agreed nor disagreed with the statement ‘Pupils/ benefit when teachers use data to inform their teaching’ why do you think this might be the case?
- Also, a large minority of students reported that they neither agreed nor disagreed with the statements ‘I use data to form small groups of pupils for targeted support’ and ‘I use data to assign or reassign pupils to classes or groups’. Why might this be the case?
- What are your views on the use of summative and formative assessment as a way to gauge pupils’ attainment and progress?

Section 2: Reflective practice.

- When reflecting on lessons that you taught, what aspects of your lesson did you see as important to focus upon?
- In what way do you use your wider professional reading within your reflections?
- What readings did you use – most frequently; least frequently and why do you think that was?
- In what way do you use advice from other professionals within and beyond the school as part of your reflective practice?
- Within your last teaching placement, what opportunities did you have to engage in discussions about pupils’ progress?
- With whom did these discussions take place?

Section 3: Use of Data in School.

We would like to explore how data was used within your placement school.

1.1 Schools use of data

- What data was used most in your placement school?
- In what way was data used?
• Who used data the most in school? (CT, PT or SMT?)

1.2 Students’ use of data
• What data did you use on placement?
• How did you use data while on placement?
• For what purpose did you use that data?

1.3 Quality of data
• How did you choose data to use?
• Where you surprised by what that data suggested in any way? If so in what way?
Appendix 2

Contextualising data use within Professional Scenario

Professional Scenario 1.

You are preparing for a parent’s night to discuss pupil progress with parents,

(a) What data would you take along to that meeting?

(b) How might you use the data available to you to steer the discussion with a child’s parent or care-giver?

(c) How would you use the data to frame your comments to a parent or care-giver of a pupil who is making little progress overall or is struggling an area of the curriculum?

(d) What would you say to the parent if they asked you what you intended to do to resolve any issue regarding their child’s progress that has arisen from the discussion?

Professional Scenario 2

You have been asked to attend meeting by your principal teacher to discuss your classes’ progress.

(a) What evidence will you gather to help you support that discussion?

(b) What are you feeling about the nature and direction of this discussion? Expand and explain any feelings by describing the feeling and why you might be feeling that way.

(c) How might you react if the PT shows concern that pupil progress in the class is falling below expectation? Think about how you might use all of the evidence available to you to add context to the situation and what idea might you bring forward to improve the situation?
